## PREFACE TO SIXTH EDITION.

IN this sixth edition the general plan remains the same as in the previous edition. Additional notes have been added in Vol. I. where necessary, and Mr. W. F. Denning and the Rev. Theodore E. R. Phillips have kindly looked through the pages, and have mainly drawn these notes up. Such notes are indicated where necessary by the letters D and P at the end. It has been found quite impracticable to give the many observations of minute details of the Sun and Planets, nor indeed is it now necessary as these are published as 'Memoirs of the British Astronomical Association' from the work of the observing sections. Where, therefore, further information is required by the amateur, these should be consulted, since the work is done most thoroughly, and the memoirs are inexpensive. As the map of Mars was quite out of date, with the kind permission of the Council of the B. A. A., a chart by Antoniadi has been reproduced. Mr. Walter Goodacre has kindly revised the chapter devoted to the Moon, and has added a series of valuable notes which are published as an appendix. The map of the Moon in the previous edition was also quite out of date, and the new one is by Mr. Goodacre, who has so thoroughly made himself the authority on this subject. Mr. Franks has kindly written a note on the micrometer, since much valuable work may be done by the amateur, even with a moderate aperture, in the measurement of double stars. The note on photography confines itself to bare details of method, and the note on the spectroscope remains the same, since the visual method has been entirely superseded by the photographic. The

blocks used in illustration of Vol. I. have been kindly lent by the Council of the R. A. S. In Vol. II. the illustrations of Nebulæ and Clusters are from plates kindly supplied by the Director of the Lick Observatory. The Editor of the *English Mechanic* has kindly lent the blocks for the test fields  $\epsilon$  Lyræ and  $\Sigma$  2773.

Vol. II. has been rewritten, and every effort has been made to bring it up to date. Publications on double stars are now numerous, but not easy of access to the amateur, and it was thought well to complete the list as far as Mag. 6.5, and to give as far as possible later measures where there is motion. In the case of some of the rapid Binaries nothing could be done beyond giving a general idea of direction and distance. For some later unpublished measures I am indebted to the kindness of the Astronomer Royal, also to Mr. Franks and Rev. Th. E. R. Phillips. Mr. Innes, at my request, undertook to bring the list of Double Stars in the Southern Hemisphere up to date, the boundary being fixed beyond S. Decl.  $31^{\circ}$ . Mr. T. Lewis, who is so eminently the authority in England on double stars, has kindly furnished me with many valuable hints. As the previous index omitting the star places was found inconvenient, a new index giving the places as well as the page is now given, on the lines kindly suggested to me by Dr. W. H. Maw, for the double stars. This has been extended to the Nebulæ, red stars, and spectroscopic objects, and it is hoped that it will meet the requirements of those who work with Equatorials. The star places are for 1920, and have been simply corrected for precession, and no greater accuracy has been aimed at than in the previous editions. Mr. W. Milburn has rendered valuable aid in arranging the stars for the new index, and in reading through the proof sheets of each volume.

## PART III.

### THE STARRY HEAVENS.

---

Lift up your eyes on high, and behold Who hath created these things that bringeth out their host by number : He calleth them all by names by the greatness of His might, for that He is strong in power ; not one faileth.—ISA. xl. 26.

---

### *DOUBLE STARS, CLUSTERS, AND NEBULÆ.*

IF the Solar System had comprised in itself the whole material creation, it would alone have abundantly sufficed to declare the glory of GOD, and in our brief review of its greatness and its wonder we have seen enough to awaken the most impressive thoughts of His power and wisdom. But that system is but as a single drop in the ocean. What boundary may be set to creation we know not, but we can trace it sufficiently to perceive that, as far as our senses are concerned, it cannot be distinguished from absolute infinity : and in leaving our Sun and his attendants in the background, we are only approaching more amazing regions, and fresh scenes will open upon us of inexpressible and awful grandeur. We are now to contemplate not one Sun, but thousands and myriads : not a planetary system of subordinate globes, but aggregations of Suns ; pairs, groups, galaxies of Suns—‘the host of heaven’—all independent in unborrowed splendour, yet many evidently,

and all by clear implication, bound together by the same universal law which keeps the pebble in its place upon the surface of the earth, and guides the falling drop of the shower, or the mist of the cataract. Many of these Suns may probably be smaller or dimmer than our own, yet others unquestionably far surpass his splendour; while as to distance, their remoteness is so inconceivable that light itself, flying with a speed which would encircle the Earth nearly 8 times in one second, only shows them to us as they formerly were, some years, others centuries, others perhaps whole ages back, even in the first dawn of creation. Here is indeed a field where enterprise cannot be thrown away, nor perseverance fail of its reward.

We must, however, remember that, though they are Suns which we are contemplating, and though the mere aspect of some of them in a large telescope well bears out the assertion,<sup>1</sup> yet a great proportion are diminished by distance to the minutest points of light, and can only be distinctly seen under favourable circumstances. We cannot therefore expect uniform success; in fact, the more delicate objects of stellar astronomy are not only among the severest tests of the telescope and the eye, but are peculiarly liable to be affected by atmospheric indistinctness, and require the most propitious skies. The cautions suggested in Part I. will be especially applicable here.

An original investigation of all the objects worthy of notice, even in a popular sense, in the starry heavens, would have been the attempt of a lifetime, rather than of such

<sup>1</sup> The approach of Sirius to the field of H.'s 40-ft. reflector is said to have been ushered in by a dawning light, and its actual entrance to have been almost intolerable to the eye: yet the 4-ft. mirror was far from good. What must be the blaze of this star in the Earl of Rosse's telescope, with a speculum of 6 ft., of much higher reflective power!

occasional hours of leisure as I could command: an unverified selection, on paper, from a standard list formed with a very different design, would have been an easy, but not a satisfactory task: a middle course has therefore been preferred. All such of the 850 Double Stars and Nebulæ of Vice-Admiral Smyth's Bedford Catalogue as my  $3\frac{7}{10}$ -in. of aperture could be expected to reach, were examined in succession,<sup>1</sup> and those only retained which seemed to possess sufficient general as well as scientific interest, and might serve as specimens of the universal profusion: but as in such a review a number of other objects, beautiful to the popular eye, though unimportant perhaps to the professed astronomer, presented themselves unsought, many of these have been added to the list, as well as many from Struve's 'Mensuræ Micrometricæ,' and other quarters. Such was the plan of the first edition. But the years that have since elapsed have brought such an unprecedented increase of observers and instruments competent to deal with a more difficult class of objects, that it has been thought desirable, without abandoning the original design or title of the work, to enlarge it in the hope of greater usefulness. An addition has accordingly been made of about 1080 pairs from Lord Lindsay's very valuable Summary of the Dorpat Catalogue, together with 70 from that of Poulkova, and many from the lists of Burnham.<sup>2</sup>

<sup>1</sup> In the present edition the colours taken from Mr. Webb's Manuscript Observations are inserted after those of  $\Sigma$ , and the date is added thus:—yw., blsh., '49.

<sup>2</sup> In the present edition an attempt has been made to complete the list of Double Stars to a certain magnitude. All Double Stars whose primary is above 6.5 (according to the authorities whence the information is taken), and their distances less than 20'', have been added as far as they could be found in the great mass of Double Star Observations now published.

The series comprises many notes on colour and magnitude, the permitted publication of which demands special acknowledgment. These may all in their way be helpful to the student. But, if diligent in the employment of opportunities, he will soon find that, as these pages are but a very limited selection from works of the highest character, so those in turn are powerless to represent even what we can reach of the unspeakable richness and grandeur of the firmament. The Dorpat Catalogue of 3062 double stars was a wonder of accuracy and perseverance: but h. considered that it included less than  $\frac{1}{3}$  of the pairs that were obvious in his sweeping: and a large proportion of these are unrecorded still.<sup>1</sup> And yet the sole, or even the chief attraction of the sidereal heavens does not lie in the juxtaposition of two stars, possibly merely accidental, and frequently beyond the reach of any but the most powerful instruments. Many parts of the sky, especially the

<sup>1</sup> The 'General Catalogue of Double Stars,' by  $\beta$ , contains 13,665 objects. Aitken has discovered at the Lick Observatory 2900 double stars, Hussey at the same observatory and at La Plata 1550, also Jonckheere at Lille has found 1067 and Innes some 1100 at the Union Observatory, S. Africa, and other observers have added to the number. Aitken has laid down limitations as to the term, Double Star, and in the revised scheme the following limits have been suggested:—

Combined mag. not to exceed

9.0.....	3''
6.0 to 9.0.....	5
6.0 to 6.0.....	10
2.0 to 4.0.....	20
Above 2.0.....	40

Such a scheme would exclude 61 Cygni, and Krueger 60,  $\theta$  Persei,  $\Sigma$  1321, and many others that are known to be physically connected—perhaps even  $\eta$  Cassiopeiæ!

crowded fields of the Galaxy, are full of most interesting and beautiful groups and combinations, of which little or no mention can be found. The attention of the professed astronomer is usually directed into some definite channel, and he has little leisure, and sometimes perhaps not much taste, for that general and indefinite sweeping and 'stargazing,' which to humbler students becomes a source of boundless delight and wonder. It need not be said that the wishes of the latter class have been chiefly considered in the following pages, though it is hoped they may be of occasional use in other ways.

From a pressure of various employments, the interval since the first appearance of this little work has not added much original matter to the following catalogue. But it is to be hoped that some zealous lover of this great display of the glory of the Creator will carry out the author's idea, and study the whole visible heavens from what might be termed a picturesque point of view. This would involve nothing more than a sufficiency of optical power, of leisure, and of patience bringing with it its abundant reward. By a suitably arranged plan, every part of the sky might be swept over in succession, and the principal instances of intensity of colour, or elegance or singularity of grouping having been noted, the materials would be prepared for a most interesting work—a *Handbook of the Wonders and Beauties of the Starry Heavens*.

A well-adjusted equatorial telescope will readily find anything in the following list from the position there given; otherwise, recourse must be had to a good globe or map. The larger Star-Maps of the Society for the Diffusion of Useful Knowledge were very carefully compiled and of much value in their day, notwithstanding a most inconvenient amount of distortion towards the sides and corners;

but in this respect, though not as regards the minute stars, they are much inferior to the Atlases of Proctor; the smaller of these was specially intended as a companion to the present work, but does not contain the additions made in this impression.<sup>1</sup> The stars, clusters, and nebulae in the following pages are divided into constellations, which are arranged alphabetically: the boundaries of Heis, in his 'Atlas Cœlestis,' have been followed; but difficulties have often arisen as to objects close on the borders, and they may have been occasionally assigned to a wrong constellation.

Pairs whose connection is ascertained are termed 'binary.' It should be observed that where change is demonstrated it does not necessarily infer binarity, as it may arise from proper motion in one or both components, and binarity is proved by common proper motion where no other change can be detected. In many cases where binarity has been inferred, later measures are given instead of 'Binary' or 'Moving.'<sup>2</sup>

<sup>1</sup> Cottam's 'Charts of the Constellations' are admirably suited as a companion Atlas to this work, for objects visible in England. The larger maps (30 × 22 ins.) easily allow of any additions being inserted, but many of the new objects in the present edition will be found there already. The smaller or popular edition has been reduced from the larger by photography. The constellations are delineated separately, and there is an excellent introduction with three key-maps. Norton's Star Atlas for 1920 is a suitable companion to this edition. Backhouse has published a Catalogue of the Magnitudes of Stars visible to the naked eye, giving the results of all previous determinations, thus bringing together in one volume a mass of material, not easily accessible to the amateur.

<sup>2</sup> A 6-in. aperture seems a small affair in these days, yet many of the latest measures given in this edition have been made with that aperture by Mr. Franks, who is doing such excellent work in measuring wide pairs. Mr. Phillips' measures with an 8-in. have

I am indebted to the kindness of G. Knott, Esq., for the following table of the equivalent telescopic star-magnitudes of Smyth, Struve ( $\Sigma$ ), Herschel II., and Argelander. It is the result of direct comparison of their respective values of the same objects: those of Argelander being carried below 9.5 m<sup>s</sup>. by inference.

Sm.	$\Sigma$	h.	Ar.
6	5.7	6.4	5.9
6.5	6.3	7.0	6.4
7	6.5	7.4	6.8
7.5	6.9	7.8	7.5
8	7.4	8.2	8.0
8.5	7.9	8.8	8.6
9	8.3	9.5	9.0
9.5	8.9	10.1	9.4
10	9.3	10.4	9.4
11	10.0	11.3	10.0
12	10.4	11.7	10.6
13	10.7	12.5	11.2
14	10.9	13.3	11.8
15	10.9	14.5	12.4
16	10.9	15.9	13.0

A subsequently published collation by Herschel II. of his own magnitudes with those of  $\Sigma$  will form an interesting addition.<sup>1</sup>

also been found most useful, and some have been made especially for this edition.

<sup>1</sup> The magnitudes of De., often quoted in the following pages, down to 10.3 practically correspond with  $\Sigma$ , but  $\Sigma$  11.2 = De. 10.1 and  $\Sigma$  12 = De. 11.7. The magnitudes of O $\Sigma$ , and De. are nearly identical.  $\Sigma$  12, however, equals O $\Sigma$  11.35.  $\beta$ 's scale = H.'s up to .78, afterwards =  $\Sigma$ . Ar. in his 'Uranometria Nova' and Heis are not subdivided decimally. Pickering by photometric measurements finds that while

The whole subject of magnitudes is, however, in an uncertain and unsatisfactory state ; an assertion which will be borne out by a collation of the best authorities with each other, with themselves on different occasions, and with the sky : and it is with pleasure that we find that stellar-photometry is being seriously taken in hand with the best appliances at the Harvard Observatory.<sup>1</sup>

The *range of visibility* is limited not only by the light of the instrument and the sensitiveness of the eye, but to an extent that could not have been anticipated, by the condition of the air. Burnham has remarked that ‘an object-glass of 6 in. one night will show the companion to Sirius perfectly : on the next night, just as good in every respect, so far as one can tell with the unaided eye, the largest telescope in the world will show no more trace of the small star than if it had been blotted out of existence.’ Burnham, Ward, Sadler, and others possessed a sight capable of detecting very minute points with small optical means, but with an eye

the brighter stars are correctly rated by Ar., the fainter stars are overrated so that 9·2 Ar. = 9·6, 9·5 Ar. = 10·5.

Σ	h.	Σ	h.	Σ	h.	Σ	h.
2·60	..... 3	6·40	..... 7	9·30	..... 11	10·87	..... 15

<sup>1</sup> Since these words were written the ‘Harvard Photometry’ has been published. This great work contains measures of magnitude of all the bright stars compared with the Pole Star. Also that Observatory has published catalogues of many fainter stars observed photometrically.

and telescope of average quality my experience leads me to believe that the range of a  $3\frac{7}{10}$ -in. object-glass will terminate among 11 m<sup>e</sup>. stars (of Smyth's scale), though from some unknown cause—possibly, as Smyth suggests, peculiarity of hue—smaller ones are sometimes to be caught.<sup>1</sup> Where I have ventured to note any discrepancy as to magnitude, it has been with a view to assist in detecting variations of light: Schr. suggested, and Humboldt is of his opinion, that variability may be the inseparable condition of all light, and the evidence of its probability is continually on the increase. As to estimates of *colour* there is also great uncertainty, arising from the differences of telescopes and eyes, and even of the states of the same eye: still there are limits of disagreement, and it is desirable to fix them, as there seems reason to believe that these colours may change: where there is any such suspicion, comparisons should be multiplied and their circumstances varied. As this is an interesting inquiry, and one suited to amateurs, I had intended to insert many more discrepancies between Smyth's colours and those of other observers; but I ultimately found that a very large proportion may be reasonably referred to the causes just mentioned, and included in the wide margin of those

<sup>1</sup> Johnson ('Radcliffe Observations,' p. 15) has given the following table, assuming that 1·0 in. will steadily show a star of 8·1 mag.:

Aperture. In.	Mag.	Aperture. In.	Mag.
1·0 .....	8·1	7·0 .....	12·6
1·5 .....	9·0	8·0 .....	12·9
2·0 .....	9·7	9·0 .....	13·2
2·5 .....	10·2	10·0 .....	13·4
3·0 .....	10·6	11·0 .....	13·6
3·5 .....	10·9	12·0 .....	13·8
4·0 .....	11·3	13·0 .....	14·0
5·0 .....	11·8	14·0 .....	14·2
6·0 .....	12·2	15·0 .....	14·4

individual peculiarities of perception or judgment which astronomers term 'personal equation,' so that a few only have been retained, either where there may be some suspicion of real alteration, or as specimens of the differences to be expected in the inquiry. I have ventured to pass by, from their obvious peculiarity, Sestini's colours,<sup>1</sup> which caused a re-examination by Smyth, published in his learned and elegant '*Ædes Hartwellianæ*,' but I have inserted some by the eminent observer Dembowski, as worthy of the highest confidence; and, in the present edition, many by modern observers. The colours of all the objects in my list, as well as many others, were carefully compared with the Bedford Catalogue: my original instrument and experience were far inferior,<sup>2</sup> and my eye usually biassed by previous knowledge, so that I was little qualified for such a scrutiny; but with a great preponderance of agreement or acquiescence, a few discrepancies were noted: dates are added, as the idea of periodical changes of tint involves no impossibility, and has been strongly advocated by Piazz Smyth. The subject is a curious one, and it would be worth while to record from time to time the colours not only of associated but single stars as they may come under our notice. The *angles of position*, which measure the inclination to the meridian, of the line joining the stars, are given in degrees, with the

<sup>1</sup> Sestini's observations were republished by Hagen in 1911 and reclassified and discussed (*Specola Astron. Vaticana*, III.).

<sup>2</sup> The subsequent great advantage of a 9½-in. silvered mirror has been less apparent here than in other respects. My experience concurs with that of Browning, who finds colour decrease with increasing aperture, so as to render stops serviceable, and of Huggins, to whom colour is imperceptible in too much or too little light. Es. and Fr. note the same fact. Es. also finds that in the case of the Red Stars there is a tendency to underrate the brighter and overrate the fainter, and the larger the instrument the more likely is this to occur.

first decimal. The following diagram, in which the direction of passage through the field is indicated, will sufficiently explain the mode of measurement ; the larger being always considered as the central star. The *distances* between the stars (always from centre to centre) are given to seconds with the first decimal place.

[After Binary and Double Stars are placed Stars with Remarkable Spectra, taken from the new edition of Birmingham's Red Star Catalogue and entered as Es.-Birm. followed by a number. Others are taken from various sources, a large number are derived from the Researches in Spectroscopic Photography undertaken with such brilliant success

at Harvard.<sup>1</sup> Stars of type IV are all red; type III, orange red; type II, yellow; type I, and most stars of the bright lined class (type V) are white. It has been shown that in every 1000 stars, 560 are of type I, 374 of type II, 65 of type III, and 1 of type IV. Of type V 108 only are known. The average of the first two magnitudes of each type is I=0.1, II=1.3, III=2.9, IV=6.1, V=8.0. May it not be possible that there is a VI type whose brightest member is yet beyond our reach? <sup>2</sup> With the stars with remarkable spectra are placed the variable stars with their elements from Chandler's Catalogue.<sup>3</sup> The short-period variables are of the first and second types, the long-period variables are of type III with bright lines of hydrogen at max. Some few are of type IV, and this fact is noted after the star's elements.] Then follow such Clusters and Nebulæ as are most conspicuous in a host of about 8000. Many of the great wonders are altogether beyond the 'common telescopes' of former years, but the unprecedented extension of optical power among amateurs has induced me to add to the previous list about 50 objects from the catalogue of h. which I have had no opportunity to examine, but which I believe will be found worthy of attention.

The Right Ascensions and Declinations have been brought up to 1920, by correcting for the Precession of the Equinoxes, which, by slowly carrying round the artificial

<sup>1</sup> The student should obtain Fleming's 'Stars having Peculiar Spectra' (*H. O. Annals*, vol. lvi., No. vi.).

<sup>2</sup> This has come true through the discovery by the late Mrs. Fleming of a VI type with a spectrum visually like the IV type but photographically different. Average mag. 8.3.

<sup>3</sup> And Harvard 2nd Cat. of Var. Stars, and other sources. It has been found impossible in the present edition to include more than the brightest ones of the enormous number discovered by photography. Over 3000 have been discovered at Harvard alone.

network of meridians and parallels in front of the immovable heavens, is continually changing the *nominal places* (not the *relative positions*) of the stars. No greater correctness is

STELLAR SPECTRA OF THE THIRD CLASS.

1  $\alpha$  Orionis, 2  $\alpha$  Herculis (Dunér).

STELLAR SPECTRA OF THE FOURTH CLASS.

1, Y Canum Ven.; 2, 19 Piscium (Dunér).

guaranteed than will answer the purpose of *finding* in a moderate-sized field. Globes and maps admitting of no such reduction will require mental allowance on this account in proportion to their date.

As to optical management; close pairs and crowded clusters gain by increasing the power; so *in general* do dissimilar colours, and very minute points near larger stars; but experience will be the best guide. For difficult pairs we should follow H.'s advice, and adjust the focus previously upon a single star of nearly the same altitude, size, and colour; the peculiar aspect of the double star will be afterwards more striking. Occasionally a slight change, especially lengthening, of focus may relieve a weary eye. In estimating colours, keep near the centre of the field: its edges may not be achromatic.<sup>1</sup> Large nebulae always require low powers; very small ones must be more magnified to show their nature, and resolvable ones, to insulate their sparkling points. In most cases low powers have the advantage from the beauty and variety of their broad fields. The magnifiers used by myself with  $3\frac{7}{10}$  inches ranged from 64 to 250, in a few instances 300.

In the following list, under the head of Double Stars,<sup>2</sup> the *Synonym*, which stands first, is either a Greek letter, which is Bayer's designation; or an Arabic numeral, which (unless otherwise specified) is Flamsteed's; to these are added in parenthesis, where practicable, an Arabic numeral, preceded by  $\Sigma$  (the conventional symbol for the name of

<sup>1</sup> All light should be covered while observing colours. A square box, enclosing the lantern, the front of which can be made to slide up and down, is very useful.

<sup>2</sup> The student who seeks further information should obtain:—

(1) Burnham's 'General Catalogue of Double Stars,' and the Appendix by Jonckheere (at present in the press).

(2) Lewis' 'Measures of Double Stars in Struve's Men. Micr.'—a most valuable and interesting memoir (*R.A.S. Memoirs*, vol. lvi.).

(3) Hussey's 'Memoir on the  $O\Sigma$  Stars' (*Lick Observatory*, vol. v.).

(4) Doolittle's 'Memoir on the Ho. Stars' (*Flower Observatory*, vol. iii.).

(5) Cat. of the Orbits of visual Binary Stars (*L.O. Bulletin*, No. 84).

Wilhelm Struve), which refers to the Dorpat Catalogue of Double Stars, or preceded by O $\Sigma$  (Otto Struve) or  $\beta$  (Burnham), etc. In the class of Clusters and Nebulæ, the prefixed number is that in the General Catalogue of Sir J. Herschel (new edition); to which is subjoined, either M., followed by a numeral referring to Messier's Catalogue of Nebulæ in the 'Connoissance des Temps' for 1783 and 1784; or H., the Roman numeral after which shows the class in the catalogues of that observer. After the Synonym comes the *Place in the Heavens*, given first in hours and minutes and decimal of a minute of Right Ascension, then in degrees and minutes of Declination, marked N. or S, as the case may be; the Italic letters, *n* (north), *s* (south), *p* (preceding), and *f* (following), being employed to indicate the relative positions of neighbouring objects. Next are placed (in the case of Double Stars) the *Magnitudes* in corresponding Arabic numerals separated by a comma. Then follow the *Position-angles*, the *Distances*, and the *Colours*;<sup>1</sup> with occasional remarks from other authorities.

For many descriptions of objects, and directions for finding them, the author is responsible.

<sup>1</sup> In the present edition, to save space, no colour is given where the stars are called white by  $\Sigma$ . Good service would be done by the amateur who, with sufficient aperture, re-examined all these stars for colour. Mr. Franks has made many valuable observations of the colours of Double Stars. One of the remarkable discoveries of modern times, in Astronomy, is that the type of spectrum (and therefore to some extent the colour), and the velocity of motion are distinctly connected, thus:—

Type B . . . . .	6.2 km.
„ A . . . . .	10.5 „
„ F . . . . .	14.4 „
„ G . . . . .	15.0 „
„ K . . . . .	16.8 „
„ M . . . . .	17.1 „

### ANDROMEDA.

THIS constellation is rich in interesting objects of every class; on the meridian, however, it is inconveniently high for an achromatic telescope, and should therefore be examined some hours E. or W. of it, like many other similarly situated regions. Its upper part towards the Galaxy contains very fine sweeping.

As the result of photos through screens with the 60-in. at Mt. Wilson, it seems extremely probable that the faint stars are appreciably redder than the bright ones. The presence of an absorbing medium in space might account for this. But if the stars really belong to the red class, then from the above table it seems probable that many faint stars will have large p.m. Barnard has lately discovered one in Ophiuchus with a p.m. of 10'' annually, which Steavenson finds to be 9 m<sup>s</sup>. and red. Its place for 1916 is R. A. xviii<sup>h</sup> 53<sup>m</sup> 44<sup>s</sup>, N. 4° 27'·4.

Kapteyn and Eddington have pointed out that all the stars are moving in one of two streams, and Kapteyn believes that the sun belongs to a cluster having an independent motion.

## DOUBLE STARS.

- $\Sigma$  3058.  $0^h 1^m \cdot 1$ , N.  $29^\circ 53'$ :  $7 \cdot 7$ ,  $9 \cdot 2$ :  $49^\circ 9'$ :  $12'' \cdot 5$ .—Fr.

 $\Sigma$  154.  $1^h 40^m.2$ , N.  $43^\circ 18'$ : 8, 8.2:  $126^\circ.7$ :  $5''.2$ .  
 $\Sigma$  162.  $1^h 44^m.2$ , N.  $47^\circ 30'$ : 7, 7.5:  $225^\circ.5$ :  $1''.9$ . Coleman,  $215^\circ.1$ : '99. *comes*  $9.7$ :  $179^\circ.5$ :  $20''.4$ . Bird, dark blue.  
 $\Sigma$  3113.  $1^h 48^m.5$ , N.  $44^\circ 15'$ : 8.7, 8.7:  $270^\circ.5$ :  $1''.5$ .  
56 ( $\Sigma$  14).  $1^h 51^m.4$ , N.  $36^\circ 52'$ : De., 5.7, 5.8:  $301^\circ.4$ :  $181''.7$ :  $y.-\beta$ ,  $187''.3$ , '03. *p* larger and ruddier, 1850; nearly equal, *p* redder, 9-in. spec. '71. Whitley, *p* smaller, *y.*, or., '69. Fr., *p* smaller, '76. Es. and  $\beta$ , *comes*  $11.4$ :  $79^\circ.6$ :  $18''.4$ .  $3^m$  *p* is  $\Sigma$  179:  $6.7, 7.7$ :  $160^\circ.4$ :  $3''.5$ .  
 $\Sigma$  195.  $1^h 55^m.2$ , N.  $44^\circ 4'$ : 8.5, 8.8:  $194^\circ.6$ :  $3''.1$ .  
 $\gamma$  ( $\Sigma$  205).  $1^h 59^m.0$ , N.  $41^\circ 51'$ : 3, 5:  $62^\circ.4$ :  $10''.3$ : Gold, blue. One of the most beautiful pairs in the heavens. It seems to have been first noticed by C. Mayer in 1788. In 1842 O $\Sigma$  found the companion double. It forms a binary system with Period of 55 years. The motion is in an elongated ellipse in the direction of  $70^\circ$ . At its greatest elongation the stars are  $0''.65$  apart, and it is now separating (Ph.,  $115^\circ.4$ :  $0''.5$ : '14) and should reach its greatest distance about 1916. It forms an admirable test object, but it is important to note the difference between one long disc crossed by a dark interference line, which is sometimes called division, and two round discs with black sky between them.  
59 ( $\Sigma$  222).  $1^h 6^m.0$ , N.  $38^\circ 39'$ : 6.7, 7.2:  $34^\circ.8$ :  $16''.4$ . Grover, neat pair,  $10' n p$  (h. 1109,  $\beta$ ,  $172^\circ.7$ :  $26''.3$ ). Neb.G.C. 828:  $90'' \pm p$ .  
 $\Sigma$  228.  $1^h 8^m.9$ , N.  $47^\circ 6'$ : 6.7, 7.6:  $262^\circ.1$ :  $1''.1$ . Ph., '13:  $110^\circ.7$ :  $0''.8$ . Bin.

Harvard the spectrum of a Nova in 1901. Rose  
to 8·4 again 1914 with very bright F.

## NEBULA AND GROUPS.

205 (H. V 18). 0<sup>h</sup> 36<sup>m</sup>·0, N. 41° 14' : Large faint oval  
neb. best with low powers : res. by Bond : a very large field  
includes it with 221 and 224. Seems to sparkle ; much  
more oval and less spindle-shaped than as drawn by Bond.

224 (M. 31). 0<sup>h</sup> 38<sup>m</sup>·4, N. 40° 50' : One of the grandest  
in the heavens ; long, oval, or irregularly triangular, ill-  
bounded, and brightening to the centre ; so plain to the  
naked eye that it is strange that the ancients scarcely  
mention it. It is, however, referred to as a familiar object  
by the Persian astronomer, Sûfi, in the tenth century. By

moving the telescope rapidly to gain contrast, Bond extended it to the surprising dimensions of  $4^\circ$  in length and  $2\frac{1}{2}^\circ$  in breadth, of which common instruments show little, and less in proportion to the increase of power. No telescope has been able to deal with its nature; Bond's  $14\frac{19}{20}$ -in. found no resolution, though it was seen through a rich stratum containing 1500 stars. It detected, however, two curious dark streaks, like narrow clefts, both beyond any ordinary instruments (but readily shown in photos as dark rings), in which the darker of them forms in reality the boundary of one side of the nebula as seen with a small aperture: both well seen by Se. with  $9\frac{9}{10}$ -in. achr.: I have caught one with difficulty with  $5\frac{1}{2}$ -in. achr., '63. Grover has seen both with  $6\frac{1}{2}$ -in. silvered mirror, and I have traced them through a long extent with 8-in. mirror (With), 1864; but this was *after the knowledge of the fact*, which has a great influence upon the eye; the truth of H.'s remark being often exemplified, that less optical power will *show* an object than was required for its discovery. Huggins finds spectrum continuous, but cut off at the red end.

Modern photos show the spectrum to be of the solar type. Fath at Mt. Wilson finds the spectrum of the Milky Way to be type G, and it has been inferred that this nebula may be an exterior Galaxy. Photos show many stars scattered over and around the nebula. Peace at Mt. Wilson gives its velocity of recession 204 miles per second. A 14 mag. *np* nucleus not always seen, 9-in. A star mag. 7 was detected near the nucleus by Ward, Aug. 19, 1885, and several other observers independently, and subsequently. It faded to 16 mag. Feb. 7, 1890; Hall, 26-in. refractor. Es. glimpsed with difficulty on March 6, with 1000 on  $17\frac{1}{4}$ -in. Es. thinks nucleus var., and sees star in it, confirmed by

PLANETARY NEBULA, H. IV 18, ANDROMEDÆ.

*Photographed at the Lick Observatory, with exposures of 10 sec., 20 sec. 30 sec.,  
1 min., 2 min.*

Young, 23-in. The spectrum of the Nova resembled the nebula, as was the case with Z Centauri.

221 (M. 32). Is in the same low-powered field: small, but bright. E. of Rosse resolved, so Buffham 9-in.; spect. like M. 31.

404 (H. II 224). Rather faint; but easy with  $9\frac{1}{2}$  in. spec.; *np*  $\beta$ , strong yellow, in the same field. D'A., strong nucleus. E. of Rosse, resolvable.

Pretty Group (O $\Sigma\Sigma$  17).  $1^h 19^m.9$ , N.  $38^\circ 37'$ .

752 (H. VII 32).  $1^h 53^m.0$ , N.  $37^\circ 17'$ : Wide, rich region, especially of small stars.

1023 (H. I 156).  $11^h 35^m.4$ , N.  $38^\circ 43'$ : One of H.'s bright class neb., lenticular, 5' long, with stellar nucleus.

7662 (H. IV 18).  $xxiii^h 22^m.0$ , N.  $42^\circ 6'$ : small, but very bright. La. sees nucleus and two oval rings, confirmed by Lick Photos, 10 sec. exposure showing nucleus and one ring, 20 sec. two rings. The outer ring seems to grow in intensity, as exposure lengthens, much more slowly than inner ring and nucleus. Barnard, nucleus var. 12-15? My  $9\frac{1}{2}$ -in. shows blsh. disc with woolly border, and suspicion of dark centre. Huggins, 8-in.; annular, grnsh. bl.; spect. four bright lines. Three small stars *np*, nearest,  $12.6 : 63^\circ.2 : 51''.3$ .

## AQUARIUS.

A dull-looking constellation, but well repaying telescopic research.

#### NEBULÆ AND GROUPS.

7009 (H. IV 1).  $xx^h 59^m.8$ , S.  $11^\circ 41'$ . Planetary: somewhat elliptic: very bright for an object of this nature; pale bl.; not well defined in  $5\frac{1}{2}$ -ft.achr., but bearing magnifying more like a planet than a common nebula. One of the finest specimens of these extraordinary bodies, to which their discoverer, H., assigned a distinct class. E. of Rosse finds a very thin ray on each side, which I saw with Huggins's 15-in.achr. La. detects within it a bright well-defined elliptic ring. Buffham, 9-in. spec., an opening. Se., who made its diameters  $25''$  and  $17''$ , saw it sparkle, and thought it a heap of stars. The spectroscope, however, of Huggins reveals the astounding fact that it is a mass of incandescent gas. About  $1\frac{1}{3}^\circ p \nu$ ,  $5 m^e$ .

7089 (M. 2).  $xxi^h 29^m.3$ , S.  $1^\circ 12'$ . Beautiful round neb. diam.  $5'$  or  $6'$ , showing with  $3\frac{7}{10}$ -in. a granulated aspect, the precursor of resolution. With 9-in. spec. resolution evident the margin seems to diffuse itself away, probably in rays. h. compares it to a heap of fine sand, and considers it to be composed of thousands of  $15 m^e$  stars. Sm. observes that "this magnificent ball of stars condenses to the centre and presents so fine a spherical form, that imagination cannot but picture the inconceivable brilliance of their visible heavens to its animated myriads."

Very curious symmetrical group,  $\pm xxiii^h 12^m$ , S.  $4^\circ 58'$ .

Fine field, *lucida*  $7 m^e$ .  $\pm xxiii^h 30^m$ , S.  $10^\circ 27'$ .

## AQUILA.

Altair (xix<sup>h</sup> 46<sup>m</sup>.9, N. 8° 39'), the lucida of this rich constellation has been thought var., and has a very sensible p.m. Ellison faint pair dist. 80" at P. 90°. Holmes pair 4<sup>m</sup> p (h. 897): 9, 11: 7" ±. All the Galaxy here is strewn with pairs and groups of stars.

## DOUBLE STARS.

## CLUSTERS AND NEBULA.

6705 (M. II). XVIII<sup>h</sup> 46<sup>m</sup>·6, S. 6° 22'. Noble fan-shaped cl., "magnifica innumerabilium stellarum coacervatio" (D'A.); at the upper edge of the broad luminous cloud which marks the shield of Sobieski. Sm. compares it to a flight of wild ducks. H., stars 11 m<sup>s</sup>. divided into 5 or 6 groups, noted independently with 5½-in. An 8 m<sup>s</sup>. star is a little within its apex; an open 8 m<sup>s</sup>. pair *sf* beyond it. H., just visible to naked eye. Sometimes placed in Scutum Sobieskii. Ellison notes "dark structures" plainly visible.

6709. Beautiful wide group, XVIII<sup>h</sup> 47<sup>m</sup>·7, N. 10° 15', 9·5-11 m<sup>s</sup>.

6724 (h. 2024). XVIII<sup>h</sup> 53<sup>m</sup>·3, N. 10° 15'. Interesting field.

6781 (H. III 743). XIX<sup>h</sup> 14<sup>m</sup>·6, N. 6° 23'. Large round faint neb., h. plan. E. of Rosse ring or spiral.

Curious line of 4 stars 8 m<sup>s</sup>., ± XIX<sup>h</sup> 22<sup>m</sup>, N. 12° 14'.

Wide group, ± XIX<sup>h</sup> 25<sup>m</sup>, N. 11° 32'.

Long narrow trapezium, XX<sup>h</sup> 9<sup>m</sup>·9, N. 16° 1'.

## ARGO NAVIS.

A constellation of vast extent, the most brilliant objects of which are invisible in England. The great nebula seems to be the centre from which Helium stars radiate in one direction into Scorpio, in the other to Orion, following the preceding branch of the Milky Way. The Bifurcation of the Milky Way commences in Argo, and while the Helium stars take the preceding section, the V-type stars take a central position, and other especial Galactic objects take the following:—The V-type stars abound in the South of Argo, and their mean deviation from the central circle of the

Galaxy is less than  $2^\circ$ . A similar distribution is found in the great Magellantic Cloud. A probable explanation of the Galaxy is that of two circles of stars which may be characterized, one as containing Helium stars, the other Gaseous neb., etc., intersecting in Argo, and again in Cepheus. We may not look upon them, however, as unrelated, but rather as strata of one epoch, differing in arrangement of material. The vast constellation has been subdivided into puppis, carina, malus, etc., but it is thought better to include all the objects under "Argo."

## CLUSTERS AND NEBULA.

2409. VII<sup>h</sup> 28<sup>m</sup>.2, S. 17° 1' : brilliant group, 8-10 m<sup>g</sup>.

2422 (H. VIII 38). VII<sup>h</sup> 32<sup>m</sup>.9, S. 14° 18'. Grand broad group, visible to the naked eye, too large even for 64 ; some brilliant 5 or 6 m<sup>g</sup>. stars, including  $\Sigma$  1121, which see *supra*. About 2½° *f* is a group round 4, 5 m<sup>g</sup>. A fiery 5 m<sup>g</sup>. (B. 7 m<sup>g</sup>.) leads the region (Es.-Birm. 238).

2437 (M. 46). VII<sup>h</sup> 38<sup>m</sup>.1, S. 14° 38'. Beautiful circular cloud of small stars (H. 10 m<sup>g</sup>.) about ½° in diam. : a little *p* the group round 4, nearer to it than 2422. 2438, a feeble neb. on its N. verge is in La.'s 20-ft. refl., 'an astonishing and interesting object' ; he and E. of Rosse see it annular : so Buffham, 9-in. 'With.'

2440 (H. IV 64). VII<sup>h</sup> 38<sup>m</sup>.3, S. 18° 1'. Plan. neb. bright ; pale blsh. w. ; H., 12" or 15". With my 64, like a dull 8 m<sup>g</sup>. star : with more power, small, brilliant, undefined, surrounded with a little very faint haziness. In a glorious neighbourhood. E. of Rosse, a red star 9-10 m<sup>g</sup>. *f*.

2447 (M. 93). VII<sup>h</sup> 41<sup>m</sup>.2, S. 23° 4'. Bright cl. in a rich neighbourhood. H., 8-13 m<sup>g</sup>.

2482. VII<sup>h</sup> 51<sup>m</sup>.5, S. 24° 5' : very rich, 10-12 m<sup>g</sup>.

2506 (H. VI 37). VII<sup>h</sup> 56<sup>m</sup>.1, S. 10° 22'. Fine broad starry cloud, from 10 m<sup>g</sup>. down to mere nebulosity ; much better with 64 than higher powers. Vicinity gorgeous.

2539 (H. VII 11). VIII<sup>h</sup> 7<sup>m</sup>.0, S. 12° 34'. Large loose cl. of stars, chiefly about 10 m<sup>g</sup>., closely *np* 19, a 6 m<sup>g</sup>. yel.

(bright or.) star, attended by a fine group. 19 seems larger than 6 m<sup>e</sup>. to my unaided eye.

## ARIES.

Three stars near together mark it to the naked eye, but it reaches some way further E. into a dull region.

AURIGA.

The leader of this beautiful constellation, Capella ( $\text{v}^{\text{h}} 10^{\text{m}}.7$ , N.  $45^{\circ} 56'$ ), is very brilliant. *h.* and  $\Sigma$  think it has increased. *h.* classed it decidedly above *Wega* in 1847, otherwise than he had formerly, and, therefore, second in the heavens. So *Galle* and *Heis*; with me, *Wega* takes precedence; but the objects are distant, and differ in colour, *w.* and sapphire, and, as *Sm.* observes, this difference may influence estimates of size. *Ptolemy*, *El Fergani* (10th cent.), and *Riccioli*, have all called *Capella red*. Its parallax, as deduced by  $O\Sigma$ , shows amazing distance, far exceeding that of some smaller stars, and requiring nearly 11 y. for the transmission of its light to us. *Peters*,

however, prefers 70 y. Spect. Bin. Barnard, *comes*: 16 : 22°·6 : 46"·6; several others more distant and brighter.

## CLUSTERS, NEBULÆ, AND GROUPS.

Fine field  $\phi$ .  $v^h 13^m.5$ , N.  $40^\circ 2'$ , including  $\lambda 5 m^e$ . Wa. 1857 (H. VII 33).  $v^h 14^m.6$ , N.  $39^\circ 16'$ . Splendid region.

19.  $v^h 14^m.5$ , N.  $33^\circ 53'$ . Grand large field.

1907 (H. VII 39).  $v^h 22^m.7$ , N.  $35^\circ 15'$ : D'A., very large cl. of minute stars arranged in curves. 11-13  $m^e$ . Ellison; 5 in., faint.

1912 (M. 38).  $v^h 23^m.3$ , N.  $35^\circ 46'$ . Noble cl. arranged as oblique cross: pair of larger stars in each arm; brighter star in centre; not brighter than pairs '71, '77. Larger stars dot it prettily with open doubles. Glorious neighbourhood.

1931 (H. I 261).  $v^h 26^m.1$ , N.  $34^\circ 11'$ . Haze surrounding 4 minute stars,  $9\frac{1}{2}$ -in. spec., '73, '76. H., 3 only in 3 obs. D'A., 5; E. of Rosse, 6; oval with branches.

1960 (M. 36).  $v^h 31^m.0$ , N.  $34^\circ 5'$ . Beautiful assemblage of stars 8 to 14  $m^e$ ., very regularly arranged.  $2^\circ f \phi$ .

2709 (M. 37).  $v^h 47^m.1$ , N.  $32^\circ 32'$ . Sm. calls this 'a magnificent object;' the whole field being strewed, as it were, with sparkling gold-dust; and the group is resolvable into about 500 stars, from 10 to 14  $m^e$ ., besides the outliers. Even in smaller instruments extremely beautiful, one of the finest of its class. Gaze at it well and long. K. notices a brighter star near centre, Burton: ruby: 10, Es.: 9.0: pale red. All the stars in the mass must be nearly at the same distance from us, and consequently their real sizes must be different. The aspect of the Nubecula Major in the S. hemisphere convinced h. of this: it is ocular proof of the incontrovertible, though long discredited fact, that the apparent brightness of stars has very little connection with

their distance from the Earth. E. of Rosse, wonderful loops and curved lines of stars, first remarked by D'A.

### BOÖTES.

A fine constellation, of which the leader, Arcturus (xiv<sup>b</sup> 12<sup>m</sup>·1, N. 19° 38'), is placed next to Sirius and before Wega, by H. and h. ; Seidel gives Wega precedence. Fletcher has rated it alternately above and below Capella. (The Harvard Photometric Results give the magnitudes of these bright stars as, Sirius — 1·43; Arcturus, 0·03; Capella, 0·18; Wega, 0·19.) A noble object at all times, but never so interesting as when enveloped in the tail of Donati's comet, 1858, Oct. 5, and only 20' from the nucleus, it flashed out so vividly its superiority. Sm. calls it reddish yel. ; it is golden yel. to me. Schm. thought it had of late years lost all redness and was growing paler. Spect. II type. The first star seen in daytime by Morin, 1635 ; it is stated, however, that Galileo saw stars by day. Schm. has seen it, *with the naked eye*, 24<sup>m</sup> before sunset. Stone finds its heating power perceptible and considerably greater than that of Wega, which, however, can be detected. Huggins gives its heat equal to that of Regulus, and  $\frac{1}{2}$  greater than that of Sirius ; Castor showing none. Arcturus has a great annual proper motion of more than 1" R.A., and nearly 2" Dec. : so that, as Humboldt says, it has moved  $2\frac{1}{2}$  times the Moon's diam. since the days of Hipparchus. Yet its parallax is almost insensible ; so that, according to Peters, we wait for its light more than 25 yrs. How inconceivable, then, must be its dimensions and its speed ! Besides this motion, Huggins finds with the spectroscope that it is approaching us at the rate of 55 miles per second ! Boötes is rich in pairs, poor in clusters and nebulæ.

## CLUSTER AND NEBULA.

- 5466 (H. VI 9). xiv<sup>h</sup> 2<sup>m</sup>·3, N. 28° 54'. Faint white cloud.  
5' to 6' in diam. h. stars 11 m<sup>e</sup>.

5820 (H. II 756).  $xiv^h 56^m.3$ , N.  $54^\circ 12'$ . Faint : guide to  $7.5 m^s$ . pair *f*, from which a straight line of small stars extends.

### CAMELOPARDUS.

Wide spread, but obscure; containing many good objects.

#### DOUBLE STARS.

- $\Sigma$  349.  $III^h 4^m.0$ , N.  $63^\circ 29'$  :  $7.4, 8.1$  :  $319^\circ.8$  :  $6''.1$ .

## CLUSTERS.

2632 (M. 44). VIII<sup>h</sup> 35<sup>m</sup>.5, N. 20° 16'. The Præsepe of the ancients, just resolved by the naked eye; too large for usual fields, but full of fine combinations. Two triangles will be noted; Galileo counted 36 stars in it, with his newly-constructed telescope.

2682 (M. 67). VIII<sup>h</sup> 26<sup>m</sup>.9, N. 12° 6'. Cl. (h., about 200 stars, 10–15 m<sup>e</sup>.) visible in finder.

## CANES VENATICI.

The nebulae here are fine. The only prominent star is Cor Caroli.

## NEBULÆ.

- 4111 (H. I 195). XII<sup>h</sup> 3<sup>m</sup>·0, N. 43° 34'. Oval, with  
 nucleus. D'A., resolved.  
 4414 (H. I 77). XII<sup>h</sup> 22<sup>m</sup>·5, N. 31° 40'. Long ; nucleus  
 like star II m<sup>s</sup>.  
 4449 (H. I 213). XII<sup>h</sup> 24<sup>m</sup>·3, N. 44° 32'. Oval, resolved.  
 D'A., unequally double. E. of Rosse, 3 nuclei.  
 4490 (H. I 198). XII<sup>h</sup> 26<sup>m</sup>·8, N. 42° 5'. Long, easily  
 resolvable. D'A., a small faint neb. *np*.  
 4631 (H. V 42). XII<sup>h</sup> 38<sup>m</sup>·2, N. 32° 59'. Very long ray  
 (D'A., 13'). A small star *p*, and beyond it a small neb.  
 Lick photo. shows two neb. probably joined.  
 4736 (M. 94). XII<sup>h</sup> 47<sup>m</sup>·1; N. 41° 33'. Small bright  
 neb., like a comet ; h., a nucleus ; E. of Rosse, spiral.  
 Lick spect., one bright band and two absorption lines.  
 5005 (H. I 96). XIII<sup>h</sup> 7<sup>m</sup>·2, N. 37° 27'. Long ; nucleus.  
 E. of Rosse, dark lanes ?  
 5055 (M. 63). XIII<sup>h</sup> 12<sup>m</sup>·2, N. 42° 27'. Oval ; not  
 bright. H. saw it 9' or 10' long, and near 4' broad, with

THE SPIRAL NEBULA, M. 51, CANUM VENATICORUM.

*Photographed at the Lick Observatory.*

a very brilliant nucleus. An 8 m<sup>e</sup>. star *p*, a minute triplet *f*. Lick photo spiral, with many knots. Huggins, spect. continuous.

5194 (M. 51). XIII<sup>h</sup> 26<sup>m</sup>.5, N. 47° 36'. E. of Rosse's wonderful spiral; its wreaths are beyond all but the first telescopes; common ones will only show two very unequal neb. nearly in contact, both brightening in the centre: traces of the halo encompassing the larger may perhaps be caught; Sm. could not do more; 'the enigma is another unequivocal mark of the illimitable power of the SUPREME CREATOR!' 9 $\frac{1}{3}$ -in. spec. showed plainly outer end of spiral, and junction with smaller neb. E. of Rosse, knots, well seen in modern photos. Huggins, spectrum not gas. A misty spot in finder 3° *sp*, Alkaid, at end of Great Bear's tail.

5272 (M. 3). XIII<sup>h</sup> 38<sup>m</sup>.5, N. 28° 47'. 'A brilliant and beautiful globular congregation of not less than 1000 small stars,' Sm., *blazing* splendidly, that is, running up into a confused brilliancy towards the centre, with many outliers. h., 11-15 m<sup>e</sup>., making lines and irregular rays. 3 $\frac{7}{10}$ -in. hardly resolved it. Buffham centrally resolved, 9-in. 'With' mirror; sprinkled over, and surrounded by the larger stars, and resolved 9 $\frac{1}{3}$ -in. spec. Photo with the 60-in. Mount Wilson shows 30,000 stars at least. Bailey finds 137 variable stars with mean P. of about half a day in this cl.

### CANIS MAJOR.

$\alpha$  (Sirius). VI<sup>h</sup> 41<sup>m</sup>.6, S. 16° 35'. This is the leader of the host of heaven: a glorious object, in all likelihood either far greater or more splendid than our Sun. It has been perceived at midday with  $\frac{1}{2}$ -in. aperture. Hevel and Bond II. saw it with the naked eye in broad sunshine; and

Plummer has seen a shadow cast by it. Its colour has probably changed. Seneca called it redder than Mars; Ptolemy classed it with the ruddy Antares. Lynn, however, doubts the construction put on the evidence. I now see it of an intense white, with a sapphire tinge, and an occasional, probably, atmospheric flash of red. Hind and Pogson have found similar decided changes of colour in variable stars. In the spectrum of Sirius, and many white stars, the lines of hydrogen are abnormally strong, all those of the metals remarkably faint. The parallax of Sirius is some nine light years. From irregularities in the proper motion of Sirius and Procyon, Bessel fully believed that each was a member of a binary system, their companions being dark and invisible. This remarkable idea has been justified by A. Clark's discovery in 1862 of a 10 m<sup>e</sup>. star, nearly at the required distance and angle, a most interesting object which, in 1862, according to Bond, was at  $84^{\circ}5' : 10''\cdot 1$ ;  $\beta$  found  $52^{\circ}4' : 10''\cdot 8$ , '78. After this it rapidly closed up.  $\beta$ ,  $359^{\circ}7' : 4''\cdot 1$ , spring of 1890, and in the autumn it was lost even in the Lick 36-in. Innes, '13:  $80^{\circ}8' : 9''\cdot 8$ ; comes almost 9 m<sup>e</sup>. He considers the Auwers Period, 49.4 years, best represents the observations. O $\Sigma$  thinks its mass must be at least half that of Sirius, but its nature very different, or it would shine as 1 m<sup>e</sup>. star. D. asks, 'Is it an enormously large globe endued with very small light-producing power? or perhaps shining by reflection from Sirius.' Auwers assumes the ratio of the mass of Sirius to that of its companion is 2.05 to 1.

#### DOUBLE STARS.

## CLUSTERS.

2287 (M. 41).  $\text{vi}^{\text{h}} 43^{\text{m}}.6$ , S.  $20^{\circ} 40'$ . Superb group, visible to naked eye,  $'51$ ,  $4^{\circ}$  beneath  $\alpha$ . Larger stars in curves, with ruddy star (Es. var. ?) near centre,  $5\frac{1}{2}$ -in. h. says the latter frequently occurs in cls. See note on Sagittarius, *infra*.

2360 (H. VII 12).  $\text{vii}^{\text{h}} 14^{\text{m}}.1$ , S.  $15^{\circ} 29'$ . Beautiful cl. h., 10 m<sup>e</sup>. melting into a very rich neighbourhood, as though the Galaxy were approaching us. 64 includes a bright w. star  $p$ . Sm. notes that the stars are nearly all 10 m<sup>e</sup>.;  $3^{\circ} f \gamma$ .

## CANIS MINOR.

$\alpha$  (Procyon). ( $\text{vii}^{\text{h}} 35^{\text{m}}.1$ , N.  $5^{\circ} 27'$ .) A fine pale y. star, to which Schæberle added the *comes*, long predicted by Bessel (see under Sirius), with the Lick 36-in. in '96 at P.  $320^{\circ}.4$  :  $4''.6$  : A., '05 :  $6^{\circ}.2$  :  $5''.1$ . 1912 invisible.

Barnard, '13:  $42^{\circ}6' : 5''1$ . Mag. according to Lewis 10. Bin., for which See suggests 40 yrs. Several dist. attendants; one 23 sec. *f*, doubled by Bird 12-in. spec., '64: 9.5, 9.8; seen by Buffham, 9-in. 'With,' and found independently with 6-in.achr. by  $\beta$  as well as by De.  $182^{\circ}6' : 0''8$ : '72. A., '96:  $187^{\circ}7'$ ,  $\beta$  comes 13,  $335^{\circ}2' : 35''9$ . 44 sec. *f* Procyon, 3' *s* is  $\Sigma$  1126:  $7'2, 7'5 : 132^{\circ} : 1''5$ : ysh. Ph., '14:  $148^{\circ}9' : 1''2$ . Amici discovered comes; Sa., with  $2\frac{1}{2}$ -in. est. 13:  $240^{\circ} : 25''$ . About  $4^m f$  19' *s* is Es.-Birm. 249:  $6'3$ : fine or., and  $3^m p$ , 8' *n*, Es.-Birm. 241: 8: pale ruby. Wa., pretty pair 35' *n* of Procyon, and 2 *comites* to star 10 *m*. *p* Procyon. Vicinity very rich in small pairs and triplets.

## CLUSTER.

7099 (M. 30).  $XXI^h 35^m \cdot 8$ , S.  $23^\circ 32'$ . Moderately bright ; beautifully contrasted with an  $8 m^e$ . star beside it ; comet-like with 64 ; with higher powers resolvable (into  $12 m^{es}$ . h.). 'What an immensity of space is indicated ! Can such an arrangement be intended, as a bungling spouter of the hour insists, for a mere appendage to the speck of a world on which we dwell, to soften the darkness of its petty midnight ? This is impeaching the intelligence of Infinite Wisdom and Power, in adapting such grand means to so disproportionate an end. No imagination can fill up the picture, of which the visual organs afford the dim outline ; and he who confidently probes the Eternal Designs cannot be many removes from lunacy' (Sm.). E. of Rosse, spiral arrangement of branches. It lies closely  $p$  a little  $n$  from  $41$ , a  $5 m^e$ . star.

## CASSIOPEIA.

Here lie a multitude of superb Galaxy fields. Birt found that the leader  $\alpha$  is var. :  $2 \cdot 2-2 \cdot 8$  : irregular. Snow always found it sharper and smaller, and more readily obscured by fog, than  $\beta$  or  $\gamma$ , even when equally bright.<sup>1</sup>

<sup>1</sup> A difference in the aspect of different stars, independent of

## DOUBLE STARS.

- $\beta$  (A. G. C. 15).  $0^h 4^m \cdot 8$ , N.  $58^\circ 43'$ :  $\beta$ , 2,  $13 \cdot 7$ :  $204^\circ \cdot 2$ :  $22'' \cdot 6$ .  $2^m 46^s$   $p$ ,  $43'$   $s$  is  $\Sigma$  3062,  $6 \cdot 9$ ,  $8$ :  $87^\circ \cdot 5$ :  $0'' \cdot 8$ : '31, an interesting Bin. which has now completed more than three-quarters of its orbit (Storey, '11:  $2^\circ \cdot 1$ :  $1'' \cdot 6$ ), now again closing. Period about III yrs.  $1^m 14^s$   $p$  of this,  $6'$   $n$ , is  $\Sigma$  3057:  $7 \cdot 2$ ,  $9 \cdot 3$ :  $299^\circ \cdot 6$ :  $3'' \cdot 6$ : ysh., ash. Nearer  $\beta$  is a curious 8  $m^e$ . triangle, suggesting (as so many others) actual, not optical vicinity; one is  $\beta$  485:  $307^\circ \cdot 4$ :  $0'' \cdot 4$ :  $8 \cdot 7$ , 9.  $15'$   $n$  of which is  $\beta$  253:  $8 \cdot 3$ ,  $8 \cdot 4$ ,  $8 \cdot 8$ :  $47^\circ \cdot 2$ ,  $346^\circ \cdot 3$ :  $0'' \cdot 6$ ,  $39'' \cdot 7$ . Fine region a little  $f$ .
- $\Sigma$  16.  $0^h 12^m \cdot 4$ , N.  $54^\circ 13'$ :  $7 \cdot 7$ , 9:  $38^\circ \cdot 2$ :  $5'' \cdot 5$ . Bird, in a vertical curve. c.p.m.
- $\beta$  392.  $0^h 12^m \cdot 6$ , N.  $61^\circ 5'$ : 6,  $12 \cdot 5$ :  $67^\circ \cdot 8$ :  $19'' \cdot 3$ .
- Hu. 506.  $0^h 20^m \cdot 2$ , N.  $51^\circ 36'$ : 6,  $8 \cdot 5$ :  $217^\circ \cdot 1$ :  $0'' \cdot 2$ .

magnitude, and sometimes of colour, has been noticed by several observers. Sm., speaking of a dull 11  $m^e$ . star seen best by averted vision, remarks that 'there are many of much smaller magnitudes which shine quite sharply, and emit a strong blue ray.' Key says, 'We constantly meet with stars which loom large with a faint light, and others again very vivid, but contracted apparently to a point.' Babinet remarks that some stars have a peculiar power of overcoming twilight. A. gives  $\zeta$  Aurigæ as a striking instance among others of singularly intense light for its magnitude. He says that red and yellow stars appear brighter in proportion to the superiority of the eye and instrument. Schm. finds that red stars gain in twilight, lose by night, as compared with wh. ones, and that the position of the eyes is of material consequence in such estimates. Es. notes that red stars gain nearly  $0 \cdot 5$   $m^e$ . in moonlight. Pickering finds that in the case of two equal stars the lower always *appears* the brighter.

#### TEMPORARY STAR.

According to Ar., it was at 0<sup>h</sup> 19<sup>m</sup>·2, N. 63° 35' that the Great New Star flamed out, Nov., 1572, speedily rivalling Venus, so as to be seen at noonday, then fading during sixteen months to utter extinction : there is some idea that similar appearances took place here in 945 and 1264 ; if so, we may possibly witness a repetition of this incomprehensible phenomenon. D'A. found a minute star, 10-11 *m*<sup>e</sup> near its place, '65, where Ar. could formerly see none. So Es., '78, '80, '89, who has examined this and neighbouring stars without finding anything remarkable in their spectra. Safarik finds it var. The colour of the great star changed from *w*., through *y*. and *r*., to *bl*. Hind thinks that several var. stars increase *bl*., are *y*. after *max*., and flash red in decreasing.

#### CLUSTERS AND GROUPS.

$\kappa$ . 0<sup>h</sup> 28<sup>m</sup>·6, N. 62° 29' : 4 : *w*., '50. A little *ysh*., '55 ; stands in a grand region. One group resembles a capital Y.

225 (H. VIII 78). 0<sup>h</sup> 38<sup>m</sup>·8, N. 61° 21'. Fine cl., somewhat like the letter W ; half way from  $\gamma$  to  $\kappa$ .

457 (H. VII 42). 1<sup>h</sup> 14<sup>m</sup>·1, N. 57° 54', is a very elegant group attending  $\phi$ , 5 *m*<sup>e</sup>. The second star lilac. Red star, 30' *n*, a little *f*  $\phi$ .

581 (M. 103).  $1^h 27^m.9$ , N.  $60^\circ 17'$ . Beautiful field.  $1^\circ f$  a little  $n$  of  $\delta$ , containing  $\Sigma 131$  *supra*, and red star.

663 (H. VI 31).  $1^h 40^m.5$ , N.  $60^\circ 51'$ . Visible in finder; field very good, 64; 80 showed Sm.'s little pair,  $\Sigma 153$ :  $8.5, 9.7$ :  $69^\circ.2$ :  $7''.5$ , but not his ruby, 8 m<sup>s</sup>., '33.

7789 (H. VI 30).  $xxiii^h 53^m.0$ , N.  $56^\circ 16'$ . Beautiful large faint cloud of minute stars; h., 11-18. 'A most superb cl.' 'A mere condensed patch,' as Sm. remarks, 'in a vast region of inexpressible splendour, spreading over many fields; including the whole Galaxy through this and the adjacent constellations.' [A beautiful group in a rich field lies about  $\frac{3}{4}^\circ f\delta$ . Glorious region between  $\pi$  and  $\alpha$ .]

### CEPHEUS.

Much more barren to the naked eye than to the telescope. Splendid sweeps and curious groups between  $\alpha$ , and the Galaxy.

#### DOUBLE STARS.

$\mu$  (var.).  $xxi^h 41^m 1$ , N.  $58^\circ 25': 4-5$ : irreg. The 'Garnet Sidus' of H., visible to naked eye,  $2\frac{1}{2}^\circ$  s of  $\nu$ . Deep orange,  $5\frac{1}{2}$ -in. '64, so Slack, '65, and  $9\frac{1}{3}$ -in. '67. Fine III type. Wide pair  $45'$  p,  $10'$  n.  $\beta$ , comes to  $\mu$ :  $12: 259^\circ 4: 19'' 2$ .

18.  $xxii^h 1^m 5$ , N.  $62^\circ 44': 5' 9$ : Ry.: III: Du.

Es.-Birm. 725.  $xxii^h 9^m 7$ , N.  $56^\circ 52': 8' 5$ : R. in cl., h.

Es.-Birm. 729.  $xxii^h 22^m 0$ , N.  $57^\circ 26': 9' 2$ : R.: E. of Rosse.

#### CLUSTERS.

6939 (H. VI 42).  $xx^h 29^m 8$ , N.  $60^\circ 22'$ . An obscure cl. of very minute stars.

7654 (M. 52).  $xxiii^h 20^m 7$ , N.  $61^\circ 9'$ . Irreg. with or. star, as is frequently the case.

#### CETUS.

Large constellation, the leader,  $\alpha$  (III type spectrum, and now inferior to  $\beta$ ; one or both may have changed), is worth

looking at, as a fine combination of a beautiful or.  $2\cdot5$  m<sup>s</sup>. star with  $5\cdot5$ , fine bl. Between them,  $f$ , is a pair  $11$  m<sup>s</sup>., the  $s$  of which Wa. doubles,  $11$ ,  $11$ : Copeland,  $225^\circ$ :  $10''\cdot2$ . Gore, two minute *comites p*,  $\alpha^2$ .

RED

SPECTRUM OF MIRA CETI.

## STARS WITH REMARKABLE SPECTRA, AND VARIABLES.

- Ll. 158.  $0^h 10^m \cdot 4$ , S.  $8^\circ 14'$ :  $5 \cdot 8$ : III: Har.  
 7.  $0^h 10^m \cdot 6$ , S.  $19^\circ 22'$ :  $5$ : III: Har.  
 T (var.).  $0^h 17^m \cdot 7$ , S.  $20^\circ 30'$ :  $5 \cdot 4$ – $6 \cdot 9$ : Irr.: Chandler.  
 S (var.).  $0^h 20^m \cdot 0$ , S.  $9^\circ 46'$ :  $7 \cdot 9$ – $14 \cdot 5$ :  $320^d \cdot 2$ : Borrelly.  
 v  $1^h 56^m \cdot 2$ , S.  $21^\circ 28'$ :  $4 \cdot 1$ : Ry.: III: Du.  
 Ll. 3717.  $1^h 56^m \cdot 5$ , S.  $9^\circ 52'$ :  $5 \cdot 8$ : Ry.: III: D'A.  
 o (Mira).  $11^h 15^m \cdot 3$ , S.  $3^\circ 20'$ :  $1 \cdot 7$ – $9 \cdot 6$ :  $331^d \cdot 6$ . Fabricius.  
 h., very full ruby; I found no trace of red, '78;  
 $\alpha$  was ruddier. Fl., less red than gas flame.  $\beta$ ,  
 comes,  $13$ :  $88^\circ 5'$ :  $75'' \cdot 3$ . An  $8 \cdot 2$ :  $82^\circ 4'$ :  $116''$ .  
 Period and brightness are not always the same.  
 One of the most interesting problems of modern  
 astronomy is the question whether the irregu-  
 larities of some var. stars may not be like the  
*maxima* and *minima* of sun spots, phases of some  
 general law. Such a connection has been shown  
 by Professor Turner to exist in the case of S Persei  
 and sun spots. Spectrum III type, with hydrogen  
 lines beyond F bright, and sometimes F.  
 R (var.).  $11^h 22^m \cdot 0$ , S.  $0^\circ 33'$ :  $7 \cdot 8$ – $14$ :  $167^d$ : Ar.  
 U (var.).  $11^h 29^m \cdot 9$ , S.  $13^\circ 30'$ :  $7 \cdot 1$ – $12 \cdot 8$ :  $235^d \cdot 8$ : Sawyer.  
 X (var.).  $11^h 15^m \cdot 3$ , S.  $1^\circ 22'$ :  $8$ – $13$ :  $176^d \cdot 5$ : Wells.  
 V (var.).  $22^h 53^m \cdot 8$ , S.  $9^\circ 24'$ :  $8 \cdot 5$ – $14 \cdot 5$ :  $261^d$ : Peters.  
 W (var.).  $22^h 58^m \cdot 0$ , S.  $15^\circ 9'$ :  $6 \cdot 5$ – $12$ :  $366^d$ : Skinner.

## NEBULÆ.

- 584 (H. I 100).  $1^h 27^m \cdot 3$ , S.  $7^\circ 17'$ : round, bright centre.  
 E. of Rosse and D'A. another fainter *sf*.  
 936 (H. IV 23).  $11^h 23^m \cdot 6$ , S.  $1^\circ 32'$ . Faint, diffused, and  
 very hazy object. Another *f*.  
 1055 (H. I 1).  $11^h 37^m \cdot 6$ , N.  $0^\circ 6'$ . Faint neb. Es.

1068 (M. 77).  $\text{II}^{\text{h}} 38^{\text{m}}.6$ , S.  $0^{\circ} 21'$ .  $1^{\circ} f\delta$ , a little s. Small, faintish; very near  $9 \text{ m}^{\text{e}}$ . star. H. thought it at least 900 times more distant than  $1 \text{ m}^{\text{e}}$ . star! But qu. these inferences now? E. of Rosse, spiral, bl. L. O. spect. 5 bright lines and two dark ones.

### COMA BERENICES.

A gathering of stars which obviously requires distance only to become a nebula to the naked eye. Sweeping poor, except *nebulæ*.

#### DOUBLE STARS.

- 2 ( $\Sigma$  1596).  $\text{XII}^{\text{h}} 0^{\text{m}}.2$ , N.  $21^{\circ} 55'$ : 6, 7.5:  $240^{\circ}.6$ :  $3''.7$ : w., bl. Yw., rosy, '48.

## CLUSTERS AND NEBULÆ.

- 4147 (H. I 19). XII<sup>h</sup> 6<sup>m</sup>.0, N. 18° 59'. Globular cl.  
 4251 (H. I 89). XII<sup>h</sup> 14<sup>m</sup>.1, N. 28° 37'. Lengthened.  
 4274 (H. I 75). XII<sup>h</sup> 15<sup>m</sup>.8, N. 30° 4'. Oblong; nucleus.  
 4278 (H. I 90). XII<sup>h</sup> 16<sup>m</sup>.1, N. 29° 43'. Nucleus like 10.  
 m<sup>g</sup>. star; a faint neb. *nf* this.  
 4382 (M. 85). XII<sup>h</sup> 21<sup>m</sup>.4, N. 18° 38'. Fair specimen of  
 the many neb. in this region; midway from 24 toward 11,  
 the nearest bright star *p*, a little *s*. D'A., fainter neb. *f*.  
 4494 (H. I 83). XII<sup>h</sup> 27<sup>m</sup>.4, N. 26° 13'. Near star 6 m<sup>g</sup>.  
 4559 (H. I 92). XII<sup>h</sup> 32<sup>m</sup>.0, N. 28° 24'. h., club-shaped.  
 L.P. spiral.  
 4565 (H. V 24). XII<sup>h</sup> 32<sup>m</sup>.4, N. 26° 26'. Long streak  
 with parallel patch on *f* edge. 'Extraordinary phenome-  
 non.' E. of Rosse, about 15', nucleus projecting into dark  
 lane, sky *p* neb. darker than elsewhere. Very faint 3 $\frac{7}{10}$ -in.;  
 well seen, 9-in. spec. Lick photo. centre cut in two by dark  
 (Absorption?) Band, and there is a central star.  
 4725 (H. I 84). XII<sup>h</sup> 46<sup>m</sup>.5, N. 25° 56'. Star-like nucl. E.  
 of Rosse, incomplete oval ring round it. L.P., spiral.  
 4826 (M. 64). XII<sup>h</sup> 52<sup>m</sup>.8, N. 22° 7'. Magnificent large  
 bright neb. blazing to a nucleus. h., resolvable, nucl. prob-  
 ably double star, with vacuity below it. E. of Rosse,  
 circular shaped, with dark and light spot on one side, around  
 which is a close cluster of well-defined little stars. Rather  
 faint 3 $\frac{7}{10}$ -in. L.P., spiral.  
 5024 (M. 53). XIII<sup>h</sup> 9<sup>m</sup>.0, N. 18° 35'. Brilliant mass of  
 minute stars (h., 11-15), blazing in centre. h., curved  
 appendages. E. of Rosse, diam. 3'. Not very bright  
 3 $\frac{7}{10}$ -in.; beautiful 9-in.

## CORONA BOREALIS.

A constellation resembling more than usual the object whose name it bears.

#### STARS WITH REMARKABLE SPECTRA, AND VARIABLES.

U (var.). xv<sup>h</sup> 14<sup>m</sup>.9, N. 31° 56' : 7.6-8.7 : 3<sup>d</sup>.4 : Algol type :  
Winnecke.

S (var.). xv<sup>h</sup> 18<sup>m</sup>.1, N. 31° 39' : 6.7-12.7 : 361<sup>d</sup>.2 : Hencke.

R (var.). xv<sup>h</sup> 45<sup>m</sup>·3, N. 28° 24' : 5·5-12·5. One of the most remarkable variables in the heavens, remaining sometimes for a year without alteration in light, sometimes falling rapidly. Es. finds var. in colour faint yellow to orange. The spectrum is peculiar, having bright lines, but probably not those of hydrogen. Sometimes bands appear. The bright lines have dark lines, as the star turns to orange, on the more refrangible side.

X (var.). xv<sup>h</sup> 45<sup>m</sup>·9, N. 36° 31' : 8·3-14 : 250<sup>d</sup> : Har.

V (var.). xv<sup>h</sup> 46<sup>m</sup>·7, N. 39° 49' : 7·2-12 : 356<sup>d</sup>·5 : IV. Dunér.

Z (var.). xv<sup>h</sup> 53<sup>m</sup>·0, N. 29° 29' : 8<11 : 260<sup>d</sup> : Har.

Es.-Birm. 446. xv<sup>h</sup> 55<sup>m</sup>·5, N. 36° 15' : 8·8 : R. : h. : III.

T (var.). xv<sup>h</sup> 56<sup>m</sup>·2, N. 26° 10' : 2-9·5. Found by B., May 12, '66, 2 m<sup>e</sup>., falling afterwards to 9 m<sup>e</sup>.; reviving to 7, and 7·5, Aug. 20, Oct. 5. Backhouse found it irregularly decreasing, '72. h. gave it 6·3 m<sup>e</sup>., '42. A., 9·5, '55. Es., '92 : 9·1, type III. Barnard, '07 : 9·4, colourless. The spectrum seems at the outburst to have resembled the variable stars, in having bright hydrogen lines. Similar outbursts on a smaller scale have been noted at Har. in the case of Z Andromedæ, and RS Ophiuchi. In the case of all these the star seems to return to its original magnitude and without showing the neb. spectrum. It is to be noted that none of these stars are near the central line of the Galaxy.

W (var.). xvi<sup>h</sup> 12<sup>m</sup>·5, N. 38° 0' : 7·8-14 : 244<sup>d</sup> : Anderson.

## CORVUS.

This small constellation contains several conspicuous stars.

## DOUBLE STARS.

- $\beta$  920. XII<sup>h</sup> 11<sup>m</sup>.6, S. 22° 54' : 6.5, 7.0. Doo., '05 : 257° 1' : 1".2 ; angle increasing.

- $\delta$  (Hk. 396). XII<sup>h</sup> 25<sup>m</sup>.7, S. 16° 4' : De., 3, 8.5 : 214° : 24".3.  
Yw., lilac, '51. c.p.m.
- $\beta$  28. XII<sup>h</sup> 25<sup>m</sup>.9, S. 12° 57' : De., 6.4, 10.2 : 353° 7' : 1".8. Doo., '05 : 11° 7' : 2".2.
- $\Sigma$  1664. XII<sup>h</sup> 34<sup>m</sup>.2, S. 11° 3' : 7.7, 8.8 : 271° 6' : 17".1 : y., bl. '30.  $\beta$ , '04 : 242° 7' : 23".6.
- $\Sigma$  1669. XII<sup>h</sup> 37<sup>m</sup>.1, S. 12° 33' : 6.5, 6.5 : 298° 9' : 5".4 : yw. Hu., '04 : 306° 5'. Sa., comes : 10.5.
- Hu. 738. XII<sup>h</sup> 39<sup>m</sup>.6, S. 11° 34' : 6.3, 11.5 : 243° 6' : 6".5.

## VARIABLES.

- R (var.). XII<sup>h</sup> 15<sup>m</sup>.5, S. 18° 48' : 7.5-12.6 : 318<sup>d</sup>.5. Kar-  
linski. 5 sec. *f*, 4' *n*, is a 7.8 : yR. : III. Du.
- $\beta$ . XII<sup>h</sup> 30<sup>m</sup>.0, S. 22° 57' : pale y., '52, is inserted to be  
watched for var. Sm. found, '31, that though  
possessing no Arabic name, and lettered  $\beta$  by Bayer,  
it was unquestionably the brightest in the con-  
stellation. H., 1783, gave the order,  $\gamma$ ,  $\delta$ ,  $\beta$ ,  $\alpha$  ;  
1796,  $\gamma$ ,  $\beta$ ,  $\delta$ ,  $\alpha$ , with but little diff. between them.  
I found them, '52, '54, '59, '61,  $\gamma$ ,  $\delta$ ,  $\beta$ ,  $\alpha$ . Fr., '78,

$\gamma$ ,  $\delta$ ,  $\beta$ ,  $\epsilon$ ,  $\alpha$ . Gould considers that  $\beta$ ,  $\gamma$ ,  $\delta$ ,  $\epsilon$  are all subject to change. Pickering finds the spectra of  $\gamma$ ,  $\delta$ , of type I, while  $\alpha$ ,  $\epsilon$ ,  $\beta$  are varieties of type II. The diff. of colour may have something to do with the apparent var.  $\gamma$  has been found to be a spect. Bin. by the Lick observers.

## NEBULA.

4361 (H. I 65). XII<sup>h</sup> 20<sup>m</sup>.4, S. 18° 20': H., resolvable. Nucleus.

## CRATER.

## CYGNUS.

This fine cruciform constellation occupies a prominent position in the Galaxy, and its low-powered fields are overpowering in magnificence. The region *s* of  $\gamma$  is remarkable as containing many red stars (which led B. to call this part of the heavens the 'Red Region of Cygnus'), also there is here a group of V type stars. The principal star, Deneb, has no perceptible parallax or proper motion; so far deserving the title, usually very inappropriate, of a fixed star; hence we must infer amazing distance, and magnitude surpassing possibly that of Arcturus, Wega, or even Sirius itself. Huggins believes that it is approaching us at about 39 miles per second. The Galaxy near  $\gamma$  begins to separate into two streams. Pickering finds that Sirian stars have a marked affinity for the Galaxy, and Monck that solar stars lie usually outside of it, and are more uniformly distributed, and have larger proper motions. Hence it is inferred that the solar stars are separate from the Sirian, and nearer to us. Du. notes that IV type stars are mainly found near the medial line of the Galaxy, and the further they are from it the brighter they are. Es. finds that the V type stars accumulate at the bifurcation of the Milky Way. Almost all the temporary stars have appeared in this part of the heavens. Planetary nebulae are also closely associated with this part of the Milky Way, and it is a highly suggestive fact that while the Nova Aurigae and other Novae turned into planetary nebulae, we have no case of a nebula condensing into a star.

## DOUBLE STARS.

y., bl. One of the finest in the heavens. I have  
seen the cols. beautifully by putting the stars out  
of focus. Sm. observes that they are actually  
different, not, as may sometimes be the case,  
complementary, from mere contrast; an effect  
which is seen when the bright y. light of a lamp  
makes the moon appear blue, and which Schm.  
witnessed to a remarkable degree at his observatory  
on Vesuvius during the great eruption of '55, when  
the sky was as green as bottle glass, and the full  
moon a lively green through openings in red clouds  
of smoke and steam. A similar result may take  
place with some double stars, but not with all, as  
is proved by hiding the larger star behind a bar  
in field. Hence artificial light is misleading in

estimating star cols. 3 has been suspected of var. Huggins finds the spectra of the pair complementary.

 Y., or gold, '28. Fr., '13: 129 $^\circ.2$ : 23 $''.5$ . s  
 61, is a purple star 10 $^{\circ}5$   $m^e$ . One of the most

interesting objects in the sky. These suns were the first of the host of heaven to reveal to Bessel ('38) the secret of their distance.<sup>1</sup> This is probably 366,400 times that of the Earth from the Sun—itsself 92,400,000 miles—a space so vast that light, which reaches from the Sun in 8<sup>m</sup>, employs nearly 6 years to traverse it : we see these stars, therefore, not as they are now—for of their present existence we have no information—but as they were 6 years ago.<sup>2</sup>  $\beta$  has shown that the motion of the two stars is rectilinear, one having an annual motion of  $5''\cdot196$  towards  $51^{\circ}5$ , the other of  $5''\cdot113$  towards  $53^{\circ}5$ . Lewis thinks, however, that the motion is not strictly rectilinear, and Adams finds that the motion in the line of sight is 62 K and 63 K respectively.

How vast must be the dimensions of this great Universe ! What a temple for the Creator's glory ! 'All the whole heavens are the Lord's,' those heavens are crowded with millions upon millions of stars ; and of all that countless multitude,

<sup>1</sup> Bessel's grand result was obtained with the Königsberg Helio-meter. The instrument, absurdly so termed, as if it were intended to measure the *Sun*, has an object glass cut into two halves ; a slight displacement of these, by producing a double image, affords the means of accurate measurement. There is a fine heliometer at Oxford,  $7\frac{1}{2}$ -in. aperture.

<sup>2</sup> From the successive transmission of light results the extraordinary fact that the aspect of the whole heavens is of unequal date, each star having its own time of 'light-passage' to our eyes, and those times immensely differing, so that there is no impossibility in Humboldt's magnificent assertion, 'much has long ceased to exist before the knowledge of its presence reaches us ; much has been otherwise arranged.' As Huggins remarks, the outburst of T Coronæ may have occurred many years ago.

millions, probably, for one, are at a distance incalculably exceeding that of 61 Cygni!

$\Sigma$  2760.  $xxi^h$   $3^m.5$ , N.  $33^\circ 49'$ :  $7.3$ ,  $8.1$ :  $223^\circ.3$ :  $13''.3$ : ysh. w., ashy.  $\beta$ , '05:  $227^\circ.2$ :  $5''.7$ .

63 (Espin 32).  $xxi^h$   $3^m.8$ , N.  $47^\circ 20'$ :  $4$ ,  $11.7$ :  $154^\circ$ :  $15''.7$ .  $4$ , orange, II type. In field,  $5'$  *n*, closely *sp* a  $9.5$   $m^e$ ., a gas. neb. found by Copeland, and independently by  $\beta$ . Visually double,  $6''$  apart, in two elongated masses, but photos show complicated plan. neb. with central star.  $4^m f$  63 is a fine wide pair,  $O\Sigma\Sigma$  215, *s* star red, type III; *n* star  $\beta$  159:  $6.1$ ,  $9.2$ :  $318^\circ.4$ :  $1''.3$ . Glorious fields near 63.

$\Sigma$  2762.  $xxi^h$   $5^m.2$ , N.  $29^\circ 53'$ :  $6$ ,  $8$ :  $315^\circ.6$ :  $3''.5$ : grnsh. w., blsh. Yw., ruddy, '50. Dist.,  $9.2$ .

III. *s* of  $\rho$ . There is also an orange star *n* of  $\rho$ .

RU (var.).  $xxi^h 37^m.9$ , N.  $53^\circ 57'$ :  $7.5-10$ :  $436^d$ : Es.

Nova.  $xxi^h 38^m.6$ , N.  $42^\circ 28'$ : 3: Nov. 24, '76, Schmidt;  
faded to  $14.5$  and so remains. The Nova appeared hazy in 1911 to Barnard with the 40-in. Yerkes, and has a focus slightly greater than an ordinary star. Barnard has done most valuable work in

comparing the foci of several of the novæ with neighbouring stars. It appears that in each case a nova becomes a planetary neb., and finally a V-type star.

Es.-Birm. 711. XXI<sup>h</sup> 38<sup>m</sup>.6, N. 35° 8' : 6.2 : IV : D'A.

SS (var.). XXI<sup>h</sup> 39<sup>m</sup>.6, N. 43° 13' : 8.4-12 : Wells. Spect. var. Hydrogen lines sometimes bright. Two spectra superimposed. The star resembles U Geminorum, in rushing up to a max. Two-thirds of the time its mag. is 11.8, about once in fifty days the light suddenly increases to 8.3, then gradually falls to 11.8. The maxima are alternately long and short (Leon Campbell).

RV (var.). XXI<sup>h</sup> 40<sup>m</sup>.0, N. 37° 39' : 7.1-9.3 : Safarik. IV.

#### CLUSTERS AND NEBULÆ.

6826 (H. IV 73). XIX<sup>h</sup> 42<sup>m</sup>.7, N. 50° 19'. Plan. Gaseous neb., mag. 8.3, diam. some 20", with 11 mag. in centre. 2<sup>m</sup> 52<sup>s</sup> f 16.

6866 (H. VII 59). XX<sup>h</sup> 1<sup>m</sup>.1, N. 43° 46'. Fine cl.

Glorious sweeping along 35° 30' culminating about 27 : XX<sup>h</sup> 2<sup>m</sup>.9, N. 35° 34'. Fr., fine trapezium  $\frac{1}{4}$ ° s of 27 : brightest beautiful double.

32. XX<sup>h</sup> 13<sup>m</sup>.0, N. 47° 28' : 5 : dull or. Marks a fine field. 4.2<sup>m</sup> f, 11' n, is U Cygni with 8.0 comes blue, B. (Es., yw., 52° 3' : 62" 7. 1<sup>m</sup> 51<sup>s</sup> p, 14' s, is a pretty pair, h. 1510 : 9.7, 10 : 334° 2' : 5".)

6910 (H. VIII 56). XX<sup>h</sup> 20<sup>m</sup>.2, N. 40° 31'. Beautiful group. h., 10-12.  $\frac{1}{2}$ ° n of  $\gamma$ , a little f.

6940 (H. VII 8). XX<sup>h</sup> 31<sup>m</sup>.2, N. 28° 2'. Field of minute stars.

6960 (H. V 15). XX<sup>h</sup> 42<sup>m</sup>.4, N. 30° 26'. Nebulous ray extending n and s of 52.

6992 (H. V 14).  $xx^h 53^m \cdot 1$ , N.  $31^\circ 23'$ . Large nebulosity in a curve. Wolf's photos show that this and 6960 are probably one large nebula.

ξ.  $xxi^h 2^m \cdot 0$ , N.  $43^\circ 36'$ . Great neb. found by Wolf on photos; sharply defined *s*, and containing a dark opening like a cross. Visible as a glow in a field glass, but brightest part scarcely visible in  $17\frac{1}{4}$ -in. reflector. Es.

7027 (Stephan.).  $xxi^h 4^m \cdot 0$ , N.  $41^\circ 55'$ . Planetary, like an 8.5 star, about 4", found by me independently, Nov. 14, '79.

Curious horseshoe, and magnificent Galaxy field.  $xxi^h 5^m \cdot 5$ , N.  $46^\circ 55' \cdot 8$ . Es.

7092 (M. 39).  $xxi^h 29^m \cdot 4$ , N.  $48^\circ 5'$ . Grand open cluster.

I had at one time projected a survey of the wonders of this region with a sweeping power; but want of leisure, an unsuitable mounting, and the astonishing profusion of magnificence, combined to render a task hopeless for me which, I trust, may be carried through by some future observer.

### DELPHINUS.

The leaders of this little, compact, fish-like constellation,  $\alpha$  and  $\beta$ , are distinguished by names which, even among the multifarious disfigurements of Oriental words, so abundant in the heavens, are pre-eminently strange—*Svalocin* and *Rotanev*. The former Sm. has justly characterized as 'cacophonous and barbaric,' and says that 'no poring into the black-letter versions of the Almagest, El Battáni, Ibn Yúnis, and other authorities, enables one to form any rational conjecture as to the misreading, miswriting, or misapplication, in which so strange a metamorphosis

could have originated.' And of *Rotanev* he observes, 'That which putteth derivation and etymology at defiance.' Where so eminent and accomplished a scholar and antiquarian did not succeed it would seem presumptuous to offer a solution, but that accident is sometimes more fortunate than study; and if the following is not after all the right key, it certainly is a marvel that it should open the lock so readily. The letters of these strange words reversed form NICOLAUS VENATOR, a Latin version of the name of NICCOLO CACCIATORE, assistant at the Palermo Observatory, in the catalogue emanating from which these stars are so denominated.<sup>1</sup> A very fine region for sweeping.

## DOUBLE STARS.

## STARS WITH REMARKABLE SPECTRA, AND VARIABLES.

- R (var.).  $xx^h 11^m 0$ , N.  $8^\circ 51'$ :  $7.6-13$ :  $284^d 4$ : Hencke.  
 Es.-Birm. 672.  $xx^h 25^m 5$ , N.  $15^\circ 56'$ :  $8.3$ : R., blue near.  
 W. III.
- Es.-Birm. 679.  $xx^h 34^m 3$ , N.  $17^\circ 59'$ :  $7$ : Yr.: III. D'A.  
 14 sec.  $p$ ,  $1' n$  is W (var.):  $9.4-12.1$ :  $4^d 8$ : Algol  
 type. Wells.
- S (var.).  $xx^h 39^m 4$ , N.  $16^\circ 48'$ :  $8.4-12$ :  $277^d 5$ : Baxendell, an  $8.5$  near, same col.
- T (var.).  $xx^h 41^m 6$ , N.  $16^\circ 6'$ :  $8.2 < 13$ :  $331^d 2$ : Baxendell.
- U (var.).  $xx^h 41^m 8$ , N.  $17^\circ 48'$ :  $6.4-7.3$ : Irr.: D'A. Fine  
 III: a  $9^m 6$ . 18 sec.  $p$ ,  $10' n$ , same col. Es.
- V (var.).  $xx^h 44^m 1$ , N.  $19^\circ 2'$ :  $7.5 < 17$ :  $532^d$ : Fleming.
- X (var.).  $xx^h 51^m 2$ , N.  $17^\circ 21'$ :  $8-13$ :  $277^d$ : Anderson.

## NEBULÆ.

6905 (H. IV 16).  $xx^h 18^m 8$ , N.  $19^\circ 51'$ . Small, faint, misty, ill-defined, closely surrounded by several small stars. E. of R., spiral.

6934 (H. I 103).  $xx^h 30^m 3$ , N.  $7^\circ 8'$ . H., bright, large, resolved, 16-20  $m^6$ . D'A., easy.

## DRACO.

A long, winding constellation, always above the horizon; in consequence of which its stars, like all others in the Arctic Circle, appear at different times *entirely reversed* in relative position. A careful attention to  $p$  and  $f$ , that is, to the direction of apparent motion through the field, is in these cases required, to ensure identification. Here are many fine pairs.

### NEBULÆ.

3147 (H. I 79). x<sup>h</sup> 10<sup>m</sup>.1, N. 73° 50' : D'A., nucleus.

5866 (H. I 215). xv<sup>h</sup> 4<sup>m</sup>.3, N. 56° 5' : H., very bright. D'A., 90" × 30". Not gaseous.

6543 (H. IV 37). xvii<sup>h</sup> 58<sup>m</sup>.6, N. 66° 38' : Plan. very curious. D'A., '*unica prope inter nebulas.*' I found very luminous disc, much like a considerable star out of focus. H., 35" diam. ; I saw but 15" or 20" with  $3\frac{7}{10}$ -in. : D'A., 23" × 18". Sm., pale blue. H., very small nucleus ; Bird, '63, 12-in. silv. mirror, like a 10 m<sup>e</sup>. star ; D'A., 11-12 m<sup>e</sup>., w. Huggins, gaseous spectrum ; the first of these surprising discoveries, '64, Aug. 29. Nearly half-way between Polaris and  $\gamma$  Draconis in pole of Ecliptic. About 40' *np*, Bird finds a delicate triple star, 8.4, 8.5, 11.0 between them.

### EQUULEUS.

This little asterism is easily recognised by the clustering of its stars, and its bearing from Pegasus. There are some good objects, and many interesting low-powered fields.

## DOUBLE STARS.

- $\Sigma$  2733.  $xx^h 43^m \cdot 8$ , N.  $7^\circ 2'$ : 8,  $8 \cdot 3$ :  $145^\circ 4$ :  $40'' \cdot 2$ .

## NEBULÆ.

1084 (H. I 64).  $\text{II}^{\text{h}} 42^{\text{m}}\cdot 1$ , S.  $7^{\circ} 55'$ . Oval; D'A.,  $80'' \times 50''$ .

1332 (H. I 60).  $\text{III}^{\text{h}} 22^{\text{m}}\cdot 7$ , S.  $21^{\circ} 37'$ . Neb.

1407 (H. I 107).  $\text{III}^{\text{h}} 36^{\text{m}}\cdot 6$ , S.  $18^{\circ} 50'$ . Neb., fainter *p*.

1535 (H. IV 26).  $\text{IV}^{\text{h}} 10^{\text{m}}\cdot 5$ , S.  $12^{\circ} 54'$ . Plan. bright and round, with low powers of  $3\frac{7}{10}$ -in., but not bearing magnifying. La. has described it as the most interesting and extraordinary object of the kind he had ever seen: an  $\text{II m}^{\text{e}}$ . star standing in the centre of a circular nebula, itself placed centrally upon a larger and fainter circle of hazy light. D'A. did not see this, but thought nucl. excentric, edges resolvable, and col. light bl., as E. of Rosse, who makes nucl. granular. Gaseous. Har.

## FORNAX.

A small constellation, low in our latitudes.

## DOUBLE STARS.

$\omega$  (h. 3506).  $\text{II}^{\text{h}} 30^{\text{m}}\cdot 4$ , S.  $28^{\circ} 35'$ :  $6\frac{1}{2}$ , 8: Solá:  $244^{\circ}\cdot 4$ :  $10''\cdot 5$ .

$\gamma$  ( $\beta$  877).  $\text{II}^{\text{h}} 46^{\text{m}}\cdot 3$ , S.  $24^{\circ} 53'$ : 6, 13:  $144^{\circ}\cdot 4$ :  $11''\cdot 5$ .

See 25.  $\text{III}^{\text{h}} 23^{\text{m}}\cdot 4$ , S.  $28^{\circ} 50'$ : 6.5, 11.8:  $18^{\circ}$ :  $9''\cdot 9$ .

See 26.  $\text{III}^{\text{h}} 29^{\text{m}}\cdot 0$ , S.  $24^{\circ} 53'$ : 6, 6:  $180^{\circ}$ :  $0''\cdot 2$ .

## VARIABLES.

R (var.).  $\text{II}^{\text{h}} 25^{\text{m}}\cdot 7$ , S.  $26^{\circ} 27'$ : 8.5-11.8:  $386^{\text{d}}$ . Cordoba.

T (var.).  $\text{III}^{\text{h}} 26^{\text{m}}\cdot 2$ , S.  $28^{\circ} 41'$ : 8.5-9.7:  $92^{\text{d}}$ ? Cape.

## NEBULA.

1097 (H. V 48).  $\text{II}^{\text{h}} 42^{\text{m}}\cdot 9$ , S.  $30^{\circ} 36'$ : very bright and large.

## GEMINI.

The leading stars, in the heads of the two figures, are well known, but it requires a little attention to the globe or map to make out the whole constellation.

## DOUBLE STARS.

- $\Sigma$  830.  $v^h$   $58^m.4$ , N.  $27^\circ 39'$ :  $8.2$ ,  $8.7$ ,  $10.8$ :  $249^\circ.6$ ,  $187^\circ.7$ :  $12''.8$ ,  $25''.2$ : ysh., o., o.

- W (var.).  $\text{VI}^{\text{h}} 30^{\text{m}}.3$ , N.  $15^{\circ} 23'$  :  $6.7-7.5$  :  $7^{\text{d}}.9$ . Sawyer.
- Es. 564.  $\text{VI}^{\text{h}} 37^{\text{m}}.0$ , N.  $31^{\circ} 32'$  :  $8.1$  : IV : var. Es.
- Nova I.  $\text{VI}^{\text{h}} 39^{\text{m}}.1$ , N.  $30^{\circ} 2'$  :  $5 < 13.5$ . Found on the Oxford plates, 1903, by Turner. The spectrum passed through the usual changes of novæ and became that of a nebula. Barnard, '12 :  $16 \text{ m}^{\text{s}}$ ., still fading.
- X (var.).  $\text{VI}^{\text{h}} 42^{\text{m}}.0$ , N.  $30^{\circ} 22'$  :  $8-13$  :  $262^{\text{d}}$ . Anderson.
- Nova II.  $\text{VI}^{\text{h}} 49^{\text{m}}.7$ , N.  $32^{\circ} 14'$  :  $3.3-?$  Disc. by Enebo, 1912, before it had reached its max. According to Pickering, the spectrum on March 13th was solar,

on March 14th the hydrogen lines had broad bright bands on the edge of greater wave-length; by the 15th, the transition to the nova type was complete. There were rapid fluctuations in light subsequently, and the spectrum became discontinuous, and then nebular.

R (var.). VII<sup>h</sup> 2<sup>m</sup>.5, N. 22° 50' : 6.4-13.8 : 370<sup>d</sup>.2. Hind. F. and other lines bright.

51. VII<sup>h</sup> 8<sup>m</sup>.8, N. 16° 20' : 5.4 : III : D'A.

Es.-Birm. 225. VII<sup>h</sup> 15<sup>m</sup>.7, N. 25° 9' : var. 8.2-9 : IV. : one of a triangle. Es.

V (var.). VII<sup>h</sup> 18<sup>m</sup>.7, N. 13° 15' : 8-14.5 : 276<sup>d</sup>. Baxendell.

S (var.). VII<sup>h</sup> 38<sup>m</sup>.2, N. 23° 38' : 8.2-14.5 : 294<sup>d</sup> : Hind.

T (var.). VII<sup>h</sup> 44<sup>m</sup>.5, N. 23° 56' : 8.1 < 13.5 : 288<sup>d</sup>.1 : Hind.

U (var.). VII<sup>h</sup> 50<sup>m</sup>.4, N. 22° 13' : 8.9-14 : 86<sup>d</sup>.3, with great irregularities. Like SS Cygni, one of the most mysterious vars. Increase, '58, Nov., 1.5 m<sup>e</sup>. per day. '69, 3 m<sup>sa</sup>. in 24<sup>h</sup>! White, spect. continuous. Es. once suspected a large band. Har. Class F.

#### CLUSTERS AND NEBULÆ.

2168 (M. 35). VI<sup>h</sup> 3<sup>m</sup>.9, N. 24° 21'. Beautiful and extensive region of small stars, a neb. to naked eye. How differently La.'s 24-in. mirror shows it, his own words will best tell :—' A marvellously striking object. No one can see it for the first time without an exclamation. . . . The field of view, 19' in diam. and angular subtense 53½°, is perfectly full of brilliant stars, unusually equal in magnitude, and distribution over the whole area. Nothing but a sight of the object itself can convey an adequate idea of its exquisite beauty.' Sm. observes that the stars form curves, often

commencing with a larger one. There is an elegant festoon near centre, starting with a reddish star; 9-in. spec., '71. No ruddy star, Feb. 18, 21, '82. Es., pale y., '93. Between  $\epsilon$  Gem. and  $\zeta$  Tauri, a little *n*; in fine region. About  $\frac{1}{2}^\circ$  *sp*, just beyond a group of outliers, is 2158 (H. VI 17), a faint dim cloud of very minute stars.

Group of eleven faint neb. VII<sup>h</sup> 23<sup>m</sup>.4, N. 33° 59'.

2392 (H. IV 45). VII<sup>h</sup> 24<sup>m</sup>.4, N. 21° 5'. H. observed this object as a 9 m<sup>e</sup>. star 'with a pretty bright nebulosity, equally dispersed all round; a very remarkable phenomenon.' h. describes it as an 8 m<sup>e</sup>. star, 'exactly in the centre' (not exactly, E. of Rosse, D'A.) 'of an exactly round bright atmosphere, 25" in diam.' Sm., who rates it 7.5 m<sup>e</sup>., says he 'could only bring it to bear as a burred star.' I was so much surprised at the result in my inferior telescope, that I cannot help supposing some temporary impediment to distinct vision at Bedford, for on coming accidentally across it in 1850 I found such a conspicuous nebulosity that I thought it was either damp on the eye lens or a telescopic comet; and in 1852 I entered it as a 'blsh. nebulosity, quite like a telescopic comet.' 1865, with 5½-in., I perceived a very faint trace of a brighter border *s* a little *f*. The E. of Rosse saw a marvellous object—a star surrounded by a small circular neb., in which, close to the star, is a little black spot. This neb. is encompassed, first by a dark then by a luminous ring, very bright, and always flickering; perhaps a spiral. Buffham sees the dark ring with 9-in. 'With.' Key's 18-in. mirror showed two concentric bright rings and the dark spot, '68. A mass of luminous gas. It lies 2° *sf*  $\delta$ .

2420 (H. VI 1). VII<sup>h</sup> 33<sup>m</sup>.7, N. 21° 45'. Faint mass of very small stars. h., 11–18 m<sup>e</sup>. Beautiful and in rich region; 9-in. spec.

## HERCULES.

Some very noteworthy telescopic objects mark this constellation; and there is very fine sweeping in its *sf* portion, the *Ramus Pomifer* of Bayer, *Cerberus* of Hevel.

THE STAR CLUSTER, M. 13, HERCULIS.

*Photographed at the Lick Observatory.*

RX (var.). XVIII<sup>h</sup> 26<sup>m</sup>.9, N. 12° 33': 7-7.6: 0<sup>d</sup>.89: Algol type. Sawyer.

### CLUSTERS, NEBULÆ, AND GROUPS.

Recurved line of small stars proceeding from 7.5 m<sup>e</sup>. ± XVI<sup>h</sup> 33<sup>m</sup>.7, N. 31° 6'.<sup>1</sup>

6205 (M. 13). XVI<sup>h</sup> 38<sup>m</sup>.8, N. 36° 36'. Superb globular cl., lying  $\frac{1}{3}$  from  $\eta$  towards  $\zeta$ , finest of its class; just visible to naked eye. Halley discovered it in 1714; M. was *sure* it contained *no stars*; but it is spangled with glittering points in a 5 $\frac{1}{2}$ -ft. achromatic, and becomes a superb object in large telescopes. h. speaks of thousands of stars, 10 or 11 to 15 or 20 m<sup>e</sup>.; his father had estimated them at 14,000. Sm. calls it an extensive and magnificent mass of stars, with the most compressed part densely compacted and wedged together under unknown laws of aggregation. h. describes 'hairy-looking curvilinear branches,' well seen with 8-in. 'With' mirror; E. of Rosse, who noticed this spiral tendency, detected also three dark 'lanes' or rifts in its interior, beautifully seen by Buffham with 9-in. 'With' mirror. I have also perceived them. Huggins finds spectrum continuous, but red end wanting (see M. 31, And., and H. IV 26, Erid, *antea*). In Se.'sachr. the outliers, inconspicuous in ordinary instruments, fill a field of 8'. Ranyard, from an examination of the Lick photos., finds several prominence-like structures, composed of nebulous matter, and stars. Burnham sees a solitary close double star (0".9) near the centre, and notes that in all bright compressed clusters there seems to be a remarkable absence

<sup>1</sup> This is a specimen of a peculiarly interesting, but hitherto little noticed, class of objects to which the persevering student may make large and very curious additions, with an increasing conviction as to their mutual interdependence.

of close double stars. Klein has well remarked that our understanding strives in vain to answer the inquiry, What is the object of these thousands on thousands suns? The mere aspect of this stupendous aggregation is indeed enough to make the mind shrink with a sense of the insignificance of our little world. Yet the Christian will not forget that, as it has been nobly said, HE took of the dust of this Earth, and with it HE rules the universe!

Two stars are var. In some cl. numbers are var. and have periods of 0·4 to 0·7 of a day with a prolonged halt at min. and a var. of one magnitude. These objects are known as cluster vars.

The neighbourhood is beautiful with a low power. A faint neb.,  $\pm 40'$  *nf.* A reddish  $7\cdot7$  m<sup>e</sup>. star  $1^m 27^s f, 3' n$ , noted by D'A. as having a fine III Type spectrum, was found by Dunér to have changed to a continuous spectrum, or possibly Type II. The star is probably var., and should be watched, as there is a similar change in R Scuti.

6210 ( $\Sigma$  5 N).  $xvii^h 41^m\cdot6$ , N.  $23^\circ 57'$ . Plan. neb.,  $8''$  diam.; discovered by  $\Sigma$ . Very bright. D'A. = 8 m<sup>e</sup>.; small, not sharply defined; exactly like a star out of focus, bearing power well. III of  $5\frac{1}{2}$ -in. showed a glow round it. E. of Rosse, intense bl. Se. thought it resolved with a power of 1500; but the spectroscope shows it gaseous. Rather more than  $1^\circ$  *sp* 51, 5 m<sup>e</sup>.

6229 (H. IV 50).  $xvi^h 44^m\cdot7$ , N.  $47^\circ 40'$ . Plan. neb., faint with  $3\frac{7}{10}$ -in., but beautifully grouped in a triangle with two 6 m<sup>e</sup>. stars. D'A., very crowded cl.

6341 (M. 92).  $xvii^h 14^m\cdot7$ , N.  $43^\circ 14'$ . Very fine cl., though not equal to M. 13; less resolvable; intensely bright in centre. D'A. justly calls it, with his 11-in.achr. at Copenhagen, *acervus adspectu jucundissimus*. In H.'s reflectors, 7' or 8' diam. Buffham, with 9-in. spec., found

stars brighter and more compressed than in M. 13, but blaze resolved by glimpses. Spectrum as M. 13. E. of Rosse, possibly spiral, nucleus barely, if at all, resolved.

Wreath of stars II m<sup>e</sup>., attached to 8.5 m<sup>e</sup>.,  $\pm$  XVIII<sup>h</sup> 59<sup>m</sup>.2, N. 26° 24'.

Group.  $\pm$  XVIII<sup>h</sup> 0<sup>m</sup>, N. 19° 33': three stars in line, 8, 7, 8: w., w., pale red; *nf* of which is a fainter group with similar line of stars 10 m<sup>e</sup>.

Double chain of stars, 9 m<sup>e</sup>.,  $\pm$  XVIII<sup>h</sup> 7<sup>m</sup>, N. 23° 45'.

III. XVIII<sup>h</sup> 43<sup>m</sup>.1, N. 18° 3'. Has an interesting large field *n*, including bright or. star, B. A pair II m<sup>e</sup>. *sp*, another 6.4, 9.2, I<sup>m</sup> *p*, 18' *n*.

## HYDRA.

A very lengthy and not very interesting constellation to the unaided eye; but containing some telescopic work.

### DOUBLE STARS.

## NEBULÆ AND CLUSTER.

3242 (H. IV 27). X<sup>h</sup> 20<sup>m</sup>.9, S. 18° 14'. Plan. neb. 2° s of  $\mu$ , resembling Jupiter, Sm. says, in size, equable light, and col. I found it bright ; a little elliptical *np*, *sf*, of a steady pale bl. light, bearing high powers. H. did not resolve it. Se., whose beautifully defining glass accomplished marvels, with 1000, found it a unique object ; within a circular nebulosity two clusters, connected by two semicircular arches of stars, forming a sparkling ring, with one star on the hazy ground of the centre. D'A. made out two nuclei near the limb. Huggins sees an oval ring surrounded by broad faint nebulosity ; but its spectrum is that of gas, and the bright points can hardly be solid matter. L.P. shows nucleus and two rings.

4590 (M. 68). XII<sup>h</sup> 35<sup>m</sup>.3, S. 26° 19'. Globular cl. of stars, well resolved ; 12 m<sup>e</sup>. stars, one red.

5061 (H. I 138). XIII<sup>h</sup> 13<sup>m</sup>.7, S. 26° 19'. Very bright, small, round, nucleus, 10 m<sup>e</sup>.

## LACERTA.

A small and distinctly marked asterism. Glorious sweeping from Cygnus in this direction, and towards head of Cepheus.

## DOUBLE STARS.

## CLUSTERS.

7243 (H. VIII 75). xxii<sup>h</sup> 12<sup>m</sup>.0, N. 49° 29'. Fine cl. quickly followed by beautiful field with three pairs.

Fine field. xxii<sup>h</sup> 15<sup>m</sup>.8, N. 45° 35'.

β. xxii<sup>h</sup> 20<sup>m</sup>.4, N. 51° 51', in a glorious field. Es.

α. xxii<sup>h</sup> 28<sup>m</sup>.0, N. 49° 52', points out a noble field. 5, a 5 m<sup>e</sup>. star, 2½° sp, is a fine object, deep orange, with blue attendant in rich vicinity.

## LEO.

A fine constellation, the fore part of which is marked to the naked eye by a *sickle* of conspicuous stars. At the bottom of the handle, and very nearly in the pathway of the sun, is the leader, Regulus, the Lion's Heart.

- $\beta$ .  $x_1^h 45^m 0$ , N.  $15^\circ 2'$ : Sm.,  $2\frac{1}{2}$ , 8; bluish, dull red. Very wide.  $\beta$  603 is 19' away, at  $201^\circ 5$ : 6.4,  $10.3$ :  $328^\circ 7$ :  $1'' 2$ . A., '12:  $311^\circ 0$ :  $0'' 8$ .  $\beta$  sees two *comites* to  $\beta$ ; A., 15.5, 13.5:  $346^\circ 2$ ,  $351^\circ 4$ :  $39'' 7$ ,  $78'' 9$ .

## STARS WITH REMARKABLE SPECTRA, AND VARIABLES.

- R (var.). IX<sup>h</sup> 43<sup>m</sup>.3, N. 11° 48' : 4.6-10.5 : 312<sup>d</sup>.8 : Koch.<sup>1</sup>  
 V (var.). IX<sup>h</sup> 55<sup>m</sup>.6, N. 21° 39' : 8.6<13.5 : 273<sup>d</sup>.1 : Becker.  
 W (var.). x<sup>h</sup> 49<sup>m</sup>.4, N. 14° 8' : 9<14 : 388<sup>d</sup> : Peters.  
 56. x<sup>h</sup> 51<sup>m</sup>.9, N. 6° 36' : 6.5 : y R. : III : Vogel.  
 S (var.). XI<sup>h</sup> 6<sup>m</sup>.7, N. 5° 54' : 9-13.5 : 189<sup>d</sup>.5 : Chacornac.

## NEBULÆ.

2903, 2905 (H. I 56, 57). IX<sup>h</sup> 27<sup>m</sup>.6, N. 21° 51'. Long, with two nuclei, rather faint. H., equal. h. and D'A., *f* very faint. E. of Rosse, oblique spiral, resolved.

3379, 3384 (H. I 17, 18). x<sup>h</sup> 43<sup>m</sup>.6, N. 13° 0'. Two faint neb., *p* much larger and brighter, with stellar nucleus. H., a third, making right-angled triangle. Sm., a neat little pair, *nf*, well seen 80. Among the neb., in a round patch of 2° or 3°, in a region of few stars. 1<sup>m</sup> 4<sup>a</sup> *p* 36' *s* is M. 96. Very bright neb. E. of Rosse, spiral. 2<sup>m</sup> 48<sup>a</sup> *p* M. 96 is M. 95. E. of Rosse, two ellipses, centre resolved ?

3521 (H. I 13). XI<sup>h</sup> 1<sup>m</sup>.7, N. 0° 24'. Large, elongated. D'A., 6' × 45", with stellar nucleus. L.P., 2 neb. probably joined.

3593 (H. I 29). XI<sup>h</sup> 10<sup>m</sup>.4, N. 13° 15'. Bright, elongated.

<sup>1</sup> Hind says, 'It is one of the most fiery-looking variables on our list—fiery in every stage, from max. to min., and is really a fine telescopic object in a dark sky, when its colour forms a striking contrast with the steady wh. light of the 6 m<sup>g</sup>. a little to the *n*.' One of the finest of its most mysterious class, which deserves a special investigation, in which amateurs may do good service without costly instruments. The red hue, so conspicuous in the above specimen, prevails more or less among them; inequality or irregularity in the times of increase and decrease is common; and some appear hazy at *min*. Baxendell has noticed a singular tendency to collection in groups.

3599 (H. II 49).  $\text{XI}^{\text{h}} 11^{\text{m}}.2$ , N.  $18^{\circ} 33'$ . Small, round. Most remarkable if, as D'A. thinks, var. '31, brighter than H. III 27,  $1^{\text{m}} 22^{\text{s}} f$ ; '61, I class (so Schönfeld); '63, sometimes II, at others *invisible*; '64, not above III, and fainter than H. III 27.

3627, 3623 (M. 66, 65).  $\text{XI}^{\text{h}} 16^{\text{m}}.1$ , N.  $13^{\circ} 26'$ . Two rather faint objects, elongated visually in different directions, in a low-powered field, with several stars. *s* (M. 66) rather the larger and brighter; D'A., '*magnifica*';  $6' \times 2'$ . The other resolved in centre. L.P., both spiral.

3655 (H. I 5).  $\text{XI}^{\text{h}} 18^{\text{m}}.7$ , N.  $17^{\circ} 2'$ . Pretty bright.

3817 (h. 947).  $\text{XI}^{\text{h}} 37^{\text{m}}.7$ , N.  $10^{\circ} 45'$ . First of a faint group. H. I 21,  $1^{\text{m}} p$ ,  $70' n$ , a large bright neb.

### LEO MINOR.

This small constellation contains several pairs, and neb., but the latter too faint for general interest.

### DOUBLE STARS.

- $\Sigma$  3121.  $\text{IX}^{\text{h}} 13^{\text{m}}.1$ , N.  $28^{\circ} 55'$ :  $7.2, 7.5$ :  $20^{\circ}$ :  $0''.8$ : '32.  
Bin., 34 yrs. Angle increases. A., '12:  $186^{\circ}.1$ :  $0''.3$ .
- $\Sigma$  1369.  $\text{IX}^{\text{h}} 30^{\text{m}}.4$ , N.  $40^{\circ} 19'$ : 7, 8:  $147^{\circ}.4$ :  $24''.7$ . Fr.,  $8 \text{ m}^{\text{s}}$ .:  $324^{\circ}$ :  $118''.2$ .
- $\Sigma$  1374.  $\text{IX}^{\text{h}} 30^{\text{m}}.4$ , N.  $39^{\circ} 19'$ : 7,  $8.3$ :  $274^{\circ}.7$ :  $3''.3$ : ysh., v. bl. Do., '03:  $287^{\circ}.3$ .
- II (Hu. 1128).  $\text{IX}^{\text{h}} 30^{\text{m}}.9$ , N.  $36^{\circ} 11'$ :  $5.5, 14$ :  $35^{\circ}.1$ :  $5''.8$ .
- $\Sigma$  1421.  $\text{X}^{\text{h}} 13^{\text{m}}.6$ , N.  $27^{\circ} 56'$ :  $7.5, 8.5$ :  $330^{\circ}.4$ :  $4''.4$ .
- 31 (Hu. 879).  $\text{X}^{\text{h}} 23^{\text{m}}.3$ , N.  $37^{\circ} 7'$ : 4,  $6.5$ :  $231^{\circ}.4$ :  $0''.4$ .
- $\Sigma$  1443.  $\text{X}^{\text{h}} 28^{\text{m}}.7$ , N.  $38^{\circ} 6'$ : 9, 9:  $156^{\circ}.3$ :  $4''.8$ .
- $\Sigma$  1449.  $\text{X}^{\text{h}} 30^{\text{m}}.6$ , N.  $35^{\circ} 33'$ :  $8.5, 8.7$ :  $289^{\circ}.2$ :  $36''$ .  $\beta$ , '03:  $37''.8$ , from p.m.

- $\Sigma$  1458.  $x^h$   $35^m.0$ , N.  $32^\circ 8'$ : 8, 8.2:  $215^\circ.4$ :  $17''.7$ .  
 $\Sigma$  1459.  $x^h$   $35^m.6$ , N.  $38^\circ 50'$ : 8, 8.5:  $153^\circ.1$ :  $5''.2$ .  
 40 ( $\beta$  913).  $x^h$   $38^m.6$ , N.  $26^\circ 45'$ : 6, 13:  $122^\circ.8$ :  $10''.9$ .  
 A., '99:  $118^\circ.1$ :  $13''.1$ , from p.m.

## VARIABLES.

- R (var.).  $ix^h$   $40^m.8$ , N.  $34^\circ 53'$ : 7-13:  $370^d.5$ : Schönfeld.  
 16.  $ix^h$   $45^m.3$ , N.  $40^\circ 0'$ : R.: var. Fr., and Es. III.

## NEBULÆ.

2683 (H. I 200).  $viii^h$   $47^m.6$ , N.  $33^\circ 43'$ . H. calls this a very beautiful object,  $8' \times 3'$ . Sm. saw a splendid centre. Scarcely worth the search with  $3\frac{7}{10}$ , but in a very fine district, a little  $p$  the most  $n$  group of Cancer.

3245 (H. I 86).  $x^h$   $22^m.8$ , N.  $28^\circ 55'$ . D'A., very bright, oblong. E. of Rosse,  $6' \times 40''$ , with nucleus like a star  $11 m^e$ .

## LEPUS.

A little asterism under the legs of Orion; so near the horizon that it can only be well seen on the meridian, and opportunities must not be thrown away.

## DOUBLE STARS.

- $\beta$  314.  $iv^h$   $55^m.4$ , S.  $16^\circ 30'$ : 6.5, 8.3:  $326^\circ.9$ :  $1''$ .  
 Distant  $8.2$ .  
 $\Sigma$  631.  $iv^h$   $57^m.0$ , S.  $13^\circ 37'$ : 7.2, 8.7:  $104^\circ.8$ :  $5''.4$ .  
 See 47.  $v^h$   $6^m.4$ , S.  $22^\circ 36'$ : 6.5, 13.4:  $39^\circ.3$ :  $3''.5$ .  
 $\iota$  ( $\Sigma$  655).  $v^h$   $8^m.6$ , S.  $11^\circ 58'$ : 4.2, 10.5:  $337^\circ.6$ :  $12''.8$ :  
 grnsh., o. I found *comes* certain, '80; a glimpse star, 144,  $3\frac{7}{10}$ -in. This seems to exemplify Sm.'s

remark, that among minute stars, the smallest sometimes shines with a keener light than those of larger apparent magnitude.

- $\kappa$  ( $\Sigma$  661).  $v^h$   $9^m.5$ , S.  $13^\circ 2'$ : 5, 7.9:  $358^\circ.7$ : ( $2''.5$ ): ysh., bl. Yw., grey, '51.
- h. 3750.  $v^h$   $17^m.0$ , S.  $21^\circ 19'$ :  $\beta$ , 6, 10.5:  $283^\circ.3$ :  $4''.3$ .
- h. 3752.  $v^h$   $18^m.5$ , S.  $24^\circ 51'$ : 6, 9.5: O. Stone,  $104^\circ.7$ :  $3''.5$ , with  $9 m^e$ . near.
- $\beta$  ( $\beta$  320).  $v^h$   $24^m.8$ , S.  $20^\circ 49'$ : 3.5, 10.9: De.,  $292^\circ.3$ :  $3''.1$ .  $I^m$   $51^a$   $p$ ,  $2' n$ , is  $\beta$  319: 7.8, 11.5:  $226^\circ.6$ :  $3''.7$ .
- $\alpha$  (h. 3766).  $v^h$   $29^m.2$ , S.  $17^\circ 53'$ : Wilson, 4, 9.5:  $156^\circ.1$ :  $35''.4$ . About  $6^m f$  is h. 3780: De., 7, 8, 9, 8.5:  $6^\circ.2$ ,  $136^\circ$ ,  $298^\circ.5$ :  $76''.3$ ,  $89''.6$ ,  $126''.6$ .  $\beta$  divided 7, De., 6.8, 8.3:  $144^\circ.5$ :  $0''.7$ ; and 9, De., 9.3, 10:  $357^\circ.5$ :  $1''.3$ . Gore, beautiful cl. for small telescopes.
- $\gamma$  (Hh. 199).  $v^h$   $41^m.1$ , S.  $22^\circ 28'$ : Sm., 4, 6.5:  $349^\circ$ :  $92''.9$ . Light y., 6.5 pale grn., '32; flushed, '52. To me pale y., garnet, '51; so Sa., '74. c.p.m. Third star, 13:  $345^\circ$ :  $45''$  from 6.5. Gore, easy 3-in.; Es.,  $2\frac{1}{2}$ -in.
- $\zeta$ .  $v^h$   $43^m.3$ , S.  $14^\circ 51'$ .  $\beta$ , pair,  $45' nf$ : 6, 10: De.,  $179^\circ.4$ :  $2''.7$ .
- $\Sigma$  875.  $v^h$   $8^m.5$ , S.  $13^\circ 7'$ : 8.7, 9.8:  $335^\circ$ : 6". h., r., v. grn.  $\beta$ , '05:  $330^\circ.2$ : 5".

#### STARS WITH REMARKABLE SPECTRA, AND VARIABLES.

- R (var.).  $iv^h$   $56^m.0$ , S.  $14^\circ 56'$ : 6.1-9.7:  $436^\circ.1$ : Schmidt. Hind's 'crimson star,' '45, described by him as 'of the most intense crimson, resembling a blood-drop on the background of the sky; as regards depth of colour, no other star visible in these latitudes could be compared with it.' Type IV.

B., curious field, three pairs. and triplet,  $1^{\circ} 40' s$ , a little *p*.

T (var.).  $v^h 1^m 4$ , S.  $22^{\circ} 1'$ :  $8\cdot2-12$ :  $366^{\circ} 5$ : Har.

Es.-Birm. 120.  $v^h 7^m 6$ , S.  $11^{\circ} 57'$ :  $6\cdot5$ : R.: Morton. Var. ?

III. A little *sp u*.

Star.  $v^h 32^m 5$ , S.  $25^{\circ} 17'$ :  $7\cdot9$ : IV: Har.

S (var.).  $vi^h 2^m 5$ , S.  $24^{\circ} 11'$ :  $6\cdot5-7\cdot5$ : Sawyer.

Es.-Birm. 170.  $vi^h 3^m 6$ , S.  $21^{\circ} 48'$ :  $6\cdot1$ : III: Pickering.

19.  $vi^h 4^m 2$ , S.  $19^{\circ} 9'$ :  $5\cdot8$ : III: Pickering.

#### CLUSTER.

1904 (M. 79).  $v^h 20^m 9$ , S.  $24^{\circ} 36'$ . Tolerably bright with my 64, blazing in centre; higher powers showed it mottled. Beautiful cl. in H.'s 20-ft. reflector, nearly 3' in diam.  $4^{\circ} s$ , a little *p*  $\beta$ , closely *f* a 6  $m^s$ . star.

#### LIBRA.

S. declination combines with long days and late sunsets to give trouble in looking for the objects in this constellation, which are, however, well worth the pains.

#### DOUBLE STARS.

$\Sigma$  1833.  $xiv^h 18^m 4$ , S.  $7^{\circ} 24'$ :  $7, 7$ :  $166^{\circ} 7$ :  $4'' 9$ .

$\Sigma$  1837.  $xiv^h 20^m 4$ , S.  $11^{\circ} 18'$ :  $7\cdot1, 8\cdot7$ :  $326^{\circ} 9$ :  $1'' 4$ .  
Hu., '02:  $303^{\circ} 5$ .

$\beta$  117.  $xiv^h 26^m 9$ , S.  $15^{\circ} 15'$ :  $8, 9$ : De.,  $95^{\circ} 6$ :  $2'' 4$ .

5 (Hn. 20).  $xiv^h 41^m 6$ , S.  $15^{\circ} 7'$ :  $\beta, 6\cdot3, 11$ :  $249^{\circ} 8$ :  $2'' 7$ .

$\Sigma$  1876.  $xiv^h 42^m 1$ , S.  $7^{\circ} 3'$ :  $8\cdot1, 8\cdot6$ :  $51^{\circ} 7$ :  $1'' 2$ : ysh.  
Ph., '13:  $80^{\circ} 8$ .

$\beta$  346.  $xiv^h 44^m 1$ , S.  $17^{\circ} 0'$ : De.,  $7\cdot2, 8$ :  $235^{\circ} 7$ :  $1'' 2$ .  
Doo., '05:  $252^{\circ} 3$ :  $1'' 6$ .

- $\mu$  ( $\beta$  106).  $xiv^h$   $44^m.9$ , S.  $13^\circ 49'$ :  $5.5$ ,  $6.3$ :  $333^\circ.2$ :  $1''.5$ .  
 $\beta$ , seen  $2\frac{1}{2}$ -in. Three *comites*:  $14.5$ ,  $13.9$ ,  $12.8$ :  
 $283^\circ.7$ ,  $185^\circ.5$ ,  $232^\circ.5$ :  $18''.3$ ,  $26''$ ,  $27''.2$ .
- $\alpha^2$ .  $xiv^h$   $46^m.4$ , S.  $15^\circ 42'$ :  $3$ ,  $6$  ( $\alpha^2$ ). Pale y., whitish.  
 Wide.
- Hh. 457.  $xiv^h$   $52^m.7$ , S.  $21^\circ 2'$ :  $6$ ,  $8$ : Piazzzi,  $251^\circ.4$ :  $9''.4$ ,  
 1806. Fr., '14:  $297^\circ.3$ :  $18''.4$ . Both have large  
 p.m.,  $2''.1$  in same direction, 6 moving fastest.
- 18 ( $\Sigma$  1894).  $xiv^h$   $54^m.6$ , S.  $10^\circ 50'$ :  $6$ ,  $10.2$ :  $38^\circ.8$ :  $19''.5$ :  
 y., o.
- $\beta$  1085.  $xiv^h$   $54^m.7$ , S.  $4^\circ 40'$ :  $6$ ,  $13.2$ :  $19^\circ.5$ :  $9''.3$ .
- $\beta$  119.  $xv^h$   $1^m.3$ , S.  $6^\circ 42'$ : De.,  $8$ ,  $8.5$ :  $313^\circ.1$ :  $1''.5$ .  
 Motherwell, '08:  $303^\circ.5$ . *nf*  $\delta$ .
- $\Sigma$  3090.  $xv^h$   $4^m.6$ , S.  $0^\circ 40'$ :  $8.3$ ,  $8.7$ :  $275^\circ.5$ :  $1''.8$ .
- $\iota$  (Hh. 465).  $xv^h$   $7^m.7$ , S.  $19^\circ 30'$ :  $5$ ,  $9$ :  $110^\circ.5$ :  $57''.5$ .  
 $\beta$  doubles *comes*:  $10$ ,  $10$ :  $24^\circ.8$ :  $1''.8$ . Doo.,  
 '02:  $18^\circ.6$ .
- Hh. 467.  $xv^h$   $10^m.0$ , S.  $18^\circ 8'$ :  $\beta$ ,  $6.9$ ,  $7.7$ :  $140^\circ.2$ :  $47''.2$ .

## CLUSTERS.

5897 (H. VI 19). xv<sup>h</sup> 12<sup>m</sup>·8, S. 20° 43'. Globular cl. of small stars.

5904 (M. 5). xv<sup>h</sup> 14<sup>m</sup>·4, S. 2° 22'. Beautiful assemblage of minute stars (h., 11-15 m<sup>g</sup>.), greatly compressed in centre. M. saw none. H. about 200 with 40-ft. reflector. E. of Rosse, curved exterior branches; seen also by Buffham, with 9-in. mirror. Packer finds two stars among the outliers var. Confirmed at Harvard. Closely *np* 5 Serp. 5 m<sup>g</sup>.

## LYNX.

A troublesome constellation, excepting with an equatorial mounting, as there are few conspicuous leaders among a number of tolerably considerable stars, which are puzzling in the finder. The beauty of its pairs will, however, reward a persevering observer.

## DOUBLE STARS.

$\Sigma$  866.  $\text{vI}^{\text{h}} 10^{\text{m}}.8$ , N.  $62^{\circ} 14'$  :  $7.7, 8.8, 8.2$  :  $193^{\circ}.4, 264^{\circ}.7$  :  $17''.8, 78''.8$ .

## LYRA.

For its size, one of the most remarkable constellations, full of beautiful fields, and adorned by one of the great leaders of the firmament.

## DOUBLE STARS.

Ho. 432. XVIII<sup>h</sup> 21<sup>m</sup>.3, N. 38° 42' : 6.5, 13 : 289° 4' : 17".2.  
 $\Sigma$  2328. XVIII<sup>h</sup> 26<sup>m</sup>.4, N. 29° 52' : 8.0, 8.3 : 73° : 3".4.  
 $\beta$  1253. XVIII<sup>h</sup> 28<sup>m</sup>.8, N. 30° 30' : 6.2, 13.5 : 156° 3' : 7".4.  
 $\Sigma$  2349. XVIII<sup>h</sup> 33<sup>m</sup>.7, N. 33° 24' : 5.5, 10.7 : 205° 5' : 7".3 :  
 blsh. w., o. Wa., minute comes.  
 $\Sigma$  2351. XVIII<sup>h</sup> 33<sup>m</sup>.6, N. 41° 13' : 7.4, 7.4 : 339° 8' : 5".2.  
 Minute, but pretty.  
 $\alpha$  ( $\Sigma$  II 9). XVIII<sup>h</sup> 34<sup>m</sup>.2, N. 38° 42' : 1, 10.5 : 137° 8' :  
 34" : blsh. w., o., 1836. Wega. To my sight, inferior to Sirius only. H. and h. have ranked Arcturus and Capella higher : probably differences of colour affect materially the estimates which

different eyes form of magnitude—a supposition entertained by Sm., as well as by other observers. Wollaston's experiments, from which he allowed Wega but  $\frac{1}{9}$  of the light of Sirius, must surely have involved some fallacy. Humboldt thought it twinkled less than Arcturus and Procyon. Its colour to me pale sapphire—a lovely gem. Its enormous real bulk is evident from its very minute and doubtful parallax, giving perhaps 18 yrs. of light passage. Huggins thinks that it is approaching us at 44 to 54 miles per second. The optical attendant, whose distance is increasing (Fr., '14:  $166^{\circ}6$ :  $55''0$ ) is a well-known test: my  $3\frac{7}{10}$ -in. sometimes showed it in favourable weather. I have thought it easier with 80 than 144; De. thinks it brighter than formerly. His mean  $m^e$ . is 8.8. It must be looked for very near the rays of  $\alpha$ , as there are other very minute stars at greater distances in the field. It has been detected by Erck with  $2\frac{1}{10}$ -in. of a  $7\frac{1}{2}$ -in. achr., glimpsed by Wa. with  $1\frac{6}{10}$ -in. of  $4\frac{3}{10}$ -in. achr., and seen with  $8\frac{1}{2}$ -in. 'With' mirror less than  $30^m$  after sunset. Winnecke a fainter comes (Greenw., '99:  $285^{\circ}1$ :  $54''4$ ), also increasing in dist.  $6^m$   $p$ ,  $5'$   $s$ , is  $\Sigma$  2338: 8.5: ysh., 9.7, 8:  $300^{\circ}5$ ,  $209^{\circ}1$ :  $13''4$ ,  $77''1$ .  $1^{\circ}$   $n$  of  $\alpha$  is Es.-Birm. 555: 6.5: y.r.: III. Du. Irreg. Var. Es.

 'The naked eye,' Sm. observes, 'sees an ir-  
 regular-looking star near Wega, which separates  
 into two pretty wide ones under the slightest  
 optical aid. Each of these two will be found to be  
 a fine binary pair.' So I see it, and probably most  
 observers. H., however, Bessel at thirteen years,  
 and many others, have divided it with the naked  
 eye. The pairs have been thought to be con-  
 nected, and their p.m. is practically identical.  
 Between them lie three much smaller stars, one ( $9.5$   
 D.,  $10.1$  De.) obvious; two—the *debilissima* of h.—  
 excessively minute,  $13 \text{ m}^{\text{e}}$ . on each side of the line  
 joining  $\epsilon^1, \epsilon^2$ . In very fine weather I have had  
 glimpses of one, and suspicions of the other, with  
 $3\frac{7}{10}$ -in. —an aperture for which they are excellent  
 tests. In very fine air Wa. has seen them with  
 $2\frac{1}{8}$ -in. achr. Grover, Squire, alternately var., and  
 Fr., who has seen a little star *p* brighter than either.  
 They form Sh. 277, h.  $31^{\circ}$  in '31.  $\beta$ , '78 :  $38^{\circ}4$  :  
 $46''7$ . Es., '14 :  $37^{\circ}5 : 45''8$  from p.m. of A  
 towards  $67^{\circ}$ . Lassell added comes to B, Es., '14 :

## NEBULA, AND CLUSTER.

Sweeping between Lyra and Cygnus exceedingly fine.

6720 (M. 57). XVIII<sup>h</sup> 51<sup>m</sup>.1, N. 32° 56'. The only annular neb. accessible by common telescopes, fortunately easily found,  $\frac{1}{3}$  of the distance from  $\beta$  towards  $\gamma$ . It is somewhat oval, and bears magnifying well. Its light I have often imagined fluctuating and unsteady, like that of some other plan. neb.; an illusion arising probably from an aperture too small for the object. Lick photo. gives the impression of several rings intertwined, and Wolf finds rings of different diameters and shapes for the different monochromatic radiations. There is a small star in the centre which is very conspicuous as about 12.5 on all photographs but visually very faint (Barnard, 15.5 m<sup>s</sup>). and a still fainter one at P. 301° about 6" from nucleus. Huggins first found the spectrum gaseous. A minute star *f*; h., 11 m<sup>s</sup>.; Barnard, m<sup>s</sup>. 12.4 : P. 87° 8, D.

RING NEBULA, M. 57, LYRÆ.

*Photographed at the Lick Observatory.*

61<sup>m</sup>.7; D'A., certainly only 14, 1861. Yet Sa. caught it with 3-in.achr. '74. 34 sec. *p*, 12' *n*, is the var. RX.: 12-17: 247<sup>d</sup>. Dis. by Silbernagel.

Bright broad group. xviii<sup>h</sup> 53<sup>m</sup>.0, N. 41° 57'.

6779 (M. 56). xix<sup>h</sup> 13<sup>m</sup>.5, N. 30° 2': faintish, perhaps resolvable with 3<sup>7</sup>/<sub>10</sub>-in.; in fine field and rich region, between 3° and 4° *np* β Cygni. Sm., 'a globular cl. in a splendid field.' H., 11-14 m<sup>g</sup>.

### MONOCEROS.

Inconspicuous to the naked eye, but rich in groups and clusters, through including a brilliant part of the Galaxy.

## CLUSTERS.

2232 (10).  $\text{v}^{\text{h}} 24^{\text{m}}.0$ , S.  $4^{\circ} 43'$  : 6 pale y., the *lucida* of an elegant group, visible with naked eye. The Galaxy throughout this region well repays the trouble of sweeping.

2244 (H. VII 2).  $\text{v}^{\text{h}} 28^{\text{m}}.4$ , N.  $4^{\circ} 55'$ . Beautiful ; visible to the naked eye ; including 12, 6  $\text{m}^{\text{e}}$ . y. ; and many 7 and 9  $\text{m}^{\text{e}}$ . stars. The smallest, 14  $\text{m}^{\text{e}}$ ., run in rays. Small pair near centre.

2301 (H. VI 27).  $\text{v}^{\text{h}} 47^{\text{m}}.7$ , N.  $0^{\circ} 33'$ . Bright Galaxy cl., resembling three arms of a cross.

2323 (M. 50).  $\text{v}^{\text{h}} 59^{\text{m}}.1$ , S.  $8^{\circ} 14'$ . Brilliant cl., straggling, h. says, to  $30'$  ; containing a red star ; between Sirius

and Procyon,  $\frac{1}{3}$  nearer the former, in a superb neighbourhood, where the Creator has—

‘Sowed with stars the heaven thick as a field.’

2548 (H. VI 22). VIII<sup>h</sup> 9<sup>m</sup>·8, S. 5° 33'. Group of pretty uniform 9 m<sup>e</sup>. stars, with a profusion of lesser ones.

### OPHIUCHUS.

An extensive region, somewhat barren to the eye, but attractive to the telescope.

#### DOUBLE STARS.

- $\Sigma$  2033. XVI<sup>h</sup> 14<sup>m</sup>·0, S. 2° 5' : 8·5, 8·7 : 175°·6 : 10"·7.

## CLUSTERS AND NEBULÆ.

6171 (H. VI 40). XVI<sup>h</sup> 28<sup>m</sup>.0, S. 12° 53'. Large pale cl., best with low power. Comparative desert *f*. See M. 19 *infra*, and a list of similar vacancies in App. I.

6218 (M. 12). XVI<sup>h</sup> 43<sup>m</sup>.1, S. 1° 48' : resolvable. h., 10-16 m<sup>g</sup>. E. of Rosse, slightly spiral ; finely grouped.

6254 (M. 10). XVI<sup>h</sup> 52<sup>m</sup>.9, S. 3° 59' : bright cl. h., 11-15 m<sup>g</sup>. E. of Rosse, tendency to curved branches. A beautiful group lies *f* ; *lucida* bright or.

6273 (M. 19). XVI<sup>h</sup> 57<sup>m</sup>.7, S. 26° 9'. A mass of stars ; large, fairly bright, but very low. Near the large blank space in the body of Scorpio, where H. found scarcely any stars.

6333 (M. 9). XVII<sup>h</sup> 14<sup>m</sup>.5, S. 18° 26'. Small, apparently resolvable : ' a myriad of minute stars, clustering into a blaze in the centre, and wonderfully aggregated with numerous outliers ' (Sm.). h., 14 m<sup>g</sup>.

6402 (M. 14). XVII<sup>h</sup> 33<sup>m</sup>.4, S. 3° 12'. Large ; glimpses of resolution, effected by H. with 20-ft. refl. (h., 15 or 16 m<sup>g</sup>., ' the finest star dust.')

6494 (M. 23). XVII<sup>h</sup> 52<sup>m</sup>.2, S. 19° 1'. Grand low-power field. h., about 100 stars, 9-10 to 13 m<sup>g</sup>. Announced by increasing number.

Fine region XVIII<sup>h</sup> 2<sup>m</sup>.1, N. 4° 33'.

Curious sequence of small stars  $\pm$  XVIII<sup>h</sup> 8<sup>m</sup>.5, N. 4° 7'.

6572 ( $\Sigma$  6). XVIII<sup>h</sup> 8<sup>m</sup>.7, N. 6° 50'. Small, very bright. Considered by  $\Sigma$  one of the most curious objects in the heavens. h., slightly hazy. D'A., a little elliptical, 5" or 6", blsh. grn. Gaseous.

## ORION.

The finest constellation in the heavens, equally remarkable for telescopic interest and obvious brilliancy; fortunately its position is very suitable for English observers, as it comes to the meridian in winter, and attains a sufficient but not an inconvenient altitude. Sweeping in many parts most beautiful.

$\alpha$  (Betelgeuze).  $v^h$   $50^m.8$ , N.  $7^\circ 24'$  is irregular var. h., the discoverer, found it alternately above  $\beta$  (Rigel) and below  $\alpha$  Tauri, from 1839, Nov. 26, to 1840, Jan. 7, losing nearly half its light; afterwards its changes were much less conspicuous till 1849. 1852, Dec. 5, Fletcher thought it brighter than Capella, which he rated clearly above Wega, so that it was then the brightest star in the N. hemisphere. He also saw it nearly approaching those stars, 1865, Dec. 25. When brightest Huggins and Miller find that a group of dark lines fades out of its spectrum, which is remarkable, like that of  $\beta$  Pegasi and others, for the *extreme faintness of the lines of hydrogen*. Huggins thinks it may be receding from us 22 miles per second. Lassell says of it, 'A most beautiful and brilliant gem! Singularly beautiful in colour, a rich topaz; in hue and brilliancy different from any other star I have seen.' Look at  $\alpha$  and  $\beta$  alternately to appreciate the contrast. The spectrum is of Type III, but the bands under high dispersion are almost entirely resolved into innumerable fine lines.  $\beta$ , comes,  $14.5 : 109^\circ.5 : 39''.8$ . Three more distant.  $20' s$ , a little  $p$ , is  $\Sigma 817 : 8.2, 8.3 : 72^\circ.4 : 18''.5$ .

## CLUSTERS AND NEBULÆ.

Group with three pairs,  $1^\circ \pm p \pi^2$ ,  $iv^h 47^m$ , N.  $8^\circ 46'$ .

Pretty field, with  $\psi^1$ ,  $v^h 20^m \cdot 6$ , N.  $1^\circ 47'$ .

1976 (M. 42).  $v^h 31^m \cdot 0$ , S.  $5^\circ 26'$ . The Great Neb., one of the most wonderful objects in the heavens; readily visible to the naked eye, yet strangely missed, as Humboldt says, by Galileo, who paid great attention to Orion. Cysatus compared it telescopically with the comet of 1618. The telescope shows an irregular branching mass of greenish haze, in some directions moderately well defined where the dark sky penetrates it in deep openings: in others melting imperceptibly away over such an extent that Se., by moving his telescope rapidly to gain full contrast, has traced it in singular convolutions, and with a considerable break near  $\sigma$  through  $5\frac{1}{2}^\circ$  of Decl., and  $4^\circ$  of R.A.—from  $\zeta$  to 49, and probably H. V 38—a prodigious diffusion. Bond II also found it encompassed by a distant nebulous loop; and in various parts detected about 20 curved wreaths, indicating somewhat of a spiral structure. Its real nature was long a profound mystery. It resisted H.'s 40-ft. refl., in which it was one of the first objects

viewed, and, together with the Andromeda, suggested to him the widely discussed Nebula Hypothesis, which would see here an unformed fiery mist, the chaotic material of future suns. h. found but the aspect of 'a curdling liquid, or a surface strewed over with flocks of wool, or the breaking up of a mackerel sky.' The E. of Rosse, with his 3-ft. refl., La., with his 2-ft. spec. in the Maltese sky, could advance no further; it was long believed that the 6-ft. mirror of the E. of Rosse had lifted the veil, and distinguished in some places its starry composition; Bond, too, arrived at the same conclusion; and Se. with smaller, but very perfect means, thought he could detect the glittering 'star dust.' Yet, though this would imply a permanent form, there were strange discrepancies in the drawings of the best hands. h., in England, the same observer at the Cape of Good Hope, Bond, La., Liapounov with a  $9\frac{1}{2}$ -in.achr. at Kazan, OΣ, at Poulkova, all differ in various ways; the latter even believed that the brightness of the central part was in a state of continual variation; and the subsequently published labours of Rosse, La., and Se., are far from correspondent in detail.<sup>1</sup> All this is strange; and the spectrum analysis of Huggins has only added to the wonder by exhibiting it as a mass of incandescent gases.<sup>2</sup> In the densest part,

<sup>1</sup> The photographic plate will in time show whether any part is variable. With lenses of short focus the nebula seems on the plates to extend over the greater part of the constellation.

<sup>2</sup> Here and in H. IV 18, Androm., he sees a 4th line, and in the photo spectrum there are many others. Several nebulae show but one, probably through their faintness. The words of Seneca, aptly quoted by Humboldt, are applicable to these mysterious objects: 'Rerum natura sacra sua non simul tradit. Initiatos nos credimus; in vestibulo ejus hæremus. Illa arcana non promiscue nec omnibus patent, reducta et in interiore sacrario clausa sunt: ex quibus aliud hæc ætas, aliud quæ post nos subibit, dispiciet. Tarde magna proveniunt.'

four stars, 6, 7, 7<sup>s</sup>, 8 m<sup>e</sup>., form a trapezium known as  $\theta$  Orionis. Sm. gives their colours pale w., faint lilac, garnet, reddish.  $\beta$  and Gore have seen them with 1 $\frac{1}{2}$ -in.  $\Sigma$ ., in 1826, discovered a fifth star, which is believed to have become visible only of late years; perhaps it may be brightening, as it has been seen with 3 $\frac{8}{10}$ -in., and, it has been said, even with 2 $\frac{3}{8}$ -in. Bond's 15-in.achr. has shown it in full daylight. E. of Rosse sees it very red. h. added a 6th still smaller near the brightest star, 1830, Feb. 13, with South's 11 $\frac{3}{4}$ -in.achr. Both have been thought var.  $\beta$  has seen both with 3-in.; T. T. Smith with 3 in. of silvered mirror. Two or three other most minute points have occasionally been detected. A. G. Clark, however, added a 7th within the trapezium, with the 36-in.achr., at the Lick Observatory, and Barnard has caught another, and has found a minute and difficult pair just outside.  $\beta$  gives the following positions for the stars.

A B, 32 $^{\circ}$ ·3 : 8"·7. A C, 131 $^{\circ}$ ·3 : 12"·9. D C, 240 $^{\circ}$ ·6 : 13"·3. A E ( $\Sigma$  star), 351 $^{\circ}$ ·5 : 4"·3. C F (h.'s star), 120 $^{\circ}$ ·9 : 4". D G (Clark's star), 270 $^{\circ}$ ·5 : 7"·0. Barnard's star could not be measured, but his star, A H, 178 $^{\circ}$ ·4 : 7"·9, which is double, 16, 16·5 : 274 $^{\circ}$  : 1"·3, of which  $\beta$  says, 'It is infinitely more difficult than any double star I have ever attempted to see or measure.' O $\Sigma$  thinks that several involved stars are subject to change,<sup>1</sup> and remarks that 'the existence of so many variable stars on such a small space in the central part of the most curious nebula in the heavens must of course induce us to suppose these phenomena intimately connected with the mysterious nature of that body.' A considerable aperture will show how beautifully one large star, nearly opposite the great dark opening, is

<sup>1</sup> Over 100 have been found var. in this region by Leavett and Wolf by means of photography.

encompassed by a spiral mass of haze. Clear weather must of course be chosen, and the lowest power which will bring out the trapezium is most likely to give a satisfactory contrast with the exterior darkness.

1981 (h. 362).  $v^h$   $31^m.6$ , S.  $4^\circ 24'$ . Brilliant field, containing  $\Sigma$  750 and  $\Sigma$  743, *supra*. A grand neighbourhood; sweep well over the whole space, from 42 to  $\iota$ , which star large apertures involve in haze, connected by a long faint loop with the Great Nebula.

2022 (H. IV 34).  $v^h$   $37^m.7$ , N.  $9^\circ 2'$ . Small, distinct, faint, blsh., plan. Gaseous.

2024 (H. V 28).  $v^h$   $37^m.8$ , S.  $1^\circ 54'$ . Faint, but extensive neb. immediately *f*  $\zeta$ ; D'A., 4 large patches. 2 with  $9\frac{1}{2}$ -in. spec. Gaseous.

2068 (M. 78).  $v^h$   $42^m.6$ , N.  $0^\circ 2'$ . Singular 'wispy' neb., easily found by sweeping  $14^m$  *f*  $\delta$ ,  $20'$  *n*. Best defined *n*, E. of Rosse spiral? D'A.,  $6'$  or  $7'$ , enclosing pair,  $\beta$ ,  $9.5$ ,  $9.5 : 201^\circ.8 : 50''.7$ . Sm.,  $8.5$ ,  $9$ : stars much smaller, '50, '56, '64. D'A.,  $9$ ,  $10$ , '55;  $10$ ,  $10$ , '64. Fr.,  $11$ ,  $12$ , '79.  $\beta$ , *n* star double,  $9$ ,  $11.5 : 85^\circ.3 : 1''$ . h., 3rd star. D'A., var. 12-14?  $4^m$  *p*,  $3'$  *s* is  $\Sigma$  782 :  $7.8$ ,  $8.3 : 309^\circ.4 : 36''.2$ : w. Lick photo not spiral, but with two other neb. masses in field.

2169 (H. VIII 24).  $vi^h$   $4^m.3$ , N.  $13^\circ 58'$ . Triangular cl., containing  $\Sigma$  848 :  $7.5$ ,  $8.5 : 2''.4$ : lucid w.,  $1^\circ$  *s* of  $\nu$ . 'These gatherings, occurring indifferently upon the *Via Lactea* and off it, awaken still more our admiration of the stupendous richness of the Universe, in every department of which there appears such a profusion of creation, if we may so express ourselves of the works of the ALMIGHTY, in which our utmost ken has yet never detected any redundancy much less anything made in vain' (Sm.).

## PEGASUS.

A constellation easily recognized by the great square which three of its principal stars form with that in the head of Andromeda.

## DOUBLE STARS.

- $\Sigma$  3061.  $0^h 1^m \cdot 6$ , N.  $17^\circ 23'$ : 8, 8:  $148^\circ 4'$ :  $7'' \cdot 6$ .  $14'$  *n* is  $\Sigma$  3060:  $8 \cdot 5, 8 \cdot 5$ :  $110^\circ 5'$ :  $3'' \cdot 9$ . Ph., '14:  $122^\circ 3'$ .
- $\Sigma$  67.  $0^h 47^m \cdot 9$ , N.  $10^\circ 10'$ :  $8 \cdot 3, 9$ :  $13^\circ$ :  $1'' \cdot 6$ . Bowyer, '12:  $0'' \cdot 8$ .
- $\Sigma$  2767.  $xxi^h 6^m \cdot 8$ , N.  $19^\circ 38'$ :  $7 \cdot 8, 8 \cdot 2$ :  $30^\circ 6'$ :  $2'' \cdot 5$ .
- 1 ( $\Sigma$  II II).  $xxi^h 18^m \cdot 4$ , N.  $19^\circ 28'$ :  $4 \cdot 5, 8 \cdot 6$ :  $311^\circ 2'$ :  $36'' \cdot 2$ : v.y., o. Or., bl. '49.  $4 \cdot 5$ , var. ? c.p.m. P. Sm., comes,  $14 \cdot 5$ :  $22^\circ 6'$ :  $80'' \cdot 7$ .
- $\Sigma$  2797.  $xxi^h 22^m \cdot 8$ , N.  $13^\circ 20'$ :  $6 \cdot 7, 8 \cdot 2$ : ( $217^\circ 1'$ ):  $3'' \cdot 2$ : v.w., ash.
- $\Sigma$  2799.  $xxi^h 25^m \cdot 6$ , N.  $10^\circ 44'$ :  $6 \cdot 6, 6 \cdot 6$ :  $322^\circ 9'$ :  $1'' \cdot 4$ : ysh. Greenw., '11:  $291^\circ 2'$ . Beautiful.
- $\Sigma$  2804.  $xxi^h 29^m \cdot 3$ , N.  $20^\circ 21'$ :  $7 \cdot 3, 8$ :  $316^\circ 9'$ :  $2'' \cdot 9$ .  $\beta$ , '05:  $235^\circ 7'$ . Very beautiful.
- 3 ( $\Sigma$  I 56).  $xxi^h 33^m \cdot 7$ , N.  $6^\circ 16'$ :  $6, 7 \cdot 4$ :  $349^\circ 4'$ :  $39'' \cdot 1$ : w. W., pale bl., '50. P. Sm. thinks col. of  $7 \cdot 4$  var. De.,  $5 \cdot 5, 6 \cdot 8$ . A pretty pair in field; O $\Sigma$  443:  $8, 8 \cdot 3$  (De.,  $8 \cdot 9, 9 \cdot 2$ ):  $349^\circ 3'$ :  $7'' \cdot 9$ .
- O $\Sigma$  445.  $xxi^h 35^m \cdot 6$ , N.  $20^\circ 22'$ :  $8, 8 \cdot 5$ :  $113^\circ 1'$ :  $0'' \cdot 8$ .
- $\epsilon$ .  $xxi^h 40^m \cdot 2$ , N.  $9^\circ 31'$ :  $2 \cdot 5, \beta, 11 \cdot 5, 8 \cdot 8$ :  $325^\circ 2', 321^\circ 4'$ :  $81'' \cdot 4, 140'' \cdot 3$ . Pale y., o, bl., '47. This object, when near the meridian, will exhibit a phenomenon, noticed by h.—the pendulum-like oscillation of a small star in the same vertical with a large one, when the telescope is swung from side to side. This, he thinks, is due to the longer time

required for a fainter light to affect the retina, so that the reversal of motion is first perceived in the brighter object. I have seen this strikingly in  $\delta$  and  $\zeta$  Orion., and  $\delta$  Herc.

- $\kappa$  ( $\Sigma$  2824).  $xxi^h$   $41^m.0$ , N.  $25^\circ 17'$  :  $3.9$ ,  $10.8$  :  $308^\circ.5$  :  $11''$  : ysh., o. Lewis,  $297^\circ.4$  :  $12''.8$ . De., *comes* var. ?  $\beta$  divided  $3.9$  :  $4.8$ ,  $5.3$  : rapid Bin. Per.,  $11.5$  years. Dist. never exceeds  $0''.2$ .  $3.9$  spect. Bin. Per.,  $6^d$ . A remarkable system.
- $\Sigma$  2828.  $xxi^h$   $45^m.5$ , N.  $3^\circ 1'$  :  $8$ ,  $9$  :  $142^\circ.5$  :  $23''.8$ .  $\beta$ , '04 :  $27''.6$ . Comes to  $9$ ,  $9.2$  :  $37^\circ$  :  $3''.6$ .  $\beta$ , comes  $14$  :  $75^\circ.5$  :  $10''.3$ .
- $\Sigma$  2829.  $xxi^h$   $45^m.9$ , N.  $30^\circ 23'$  :  $8.2$ ,  $8.9$  :  $15^\circ.6$  :  $17''.1$ .
- $\Sigma$  2841.  $xxi^h$   $50^m.5$ , N.  $19^\circ 20'$  :  $6.5$ ,  $8$  :  $111^\circ$  :  $22''.2$ . v.y., bl.
- $O\Sigma$  452.  $xxi^h$   $51^m.7$ , N.  $6^\circ 52'$  :  $7.7$ ,  $8.8$  :  $179^\circ.1$  :  $1''.2$ .
- $\Sigma$  2848.  $xxi^h$   $54^m.0$ , N.  $5^\circ 33'$  :  $7.2$ ,  $7.5$  :  $54^\circ.9$  :  $10''.4$  : w., ysh. or red. '*Colores indubii*,' '29. D., v.w., '41. De., w., '63, '70. Fr., as  $\Sigma$  '76. Vogel, both y.w. '80.
- $\Sigma$  2854.  $xxii^h$   $0^m.5$ , N.  $13^\circ 16'$  :  $7.7$ ,  $8$  :  $83^\circ.1$  :  $3''.1$ .

## CLUSTER AND GROUP.

7078 (M. 15). xxi<sup>h</sup> 26<sup>m</sup>·1, N. 11° 49'. Bright and resolvable (h. 15 m<sup>e</sup>.), blazing in centre; a glorious object with 9½-in. 'With' mirror. Very fine specimen of a completely insulated cl., discovered by Miraldi, 1745. Buffham, with 9-in. spec. finds a dark patch near the middle, with 2 faint dark 'lanes' or rifts, like those in M. 13, unnoticed by h. or D'A. 51 vars. have been found in this cluster.

Bright group. xxi<sup>h</sup> 56<sup>m</sup>·5, N. 7° 14'.

## PERSEUS.

Here again we enter upon one of the most splendid portions of the Galaxy. Night after night the telescope might be employed in sweeping over its magnificent crowds of stars, among which many beautiful pairs, with the aspect of connection, would be found. This constellation includes the most conspicuous of, at least, the regularly variable stars,  $\beta$ , or Algol (iii<sup>h</sup> 3<sup>m</sup>·0, N. 40° 39'), which changes in 2<sup>d</sup>·867, the increase and decrease together occupying not more than 7<sup>h</sup>, the minimum only 18<sup>m</sup>; so that it usually appears 2 m<sup>e</sup>. Pickering has shown theoretically that the variation is due to a dark companion, and Vogel has found

displacement in the lines of the spectrum showing the revolution of a dark and bright star round their common centre of gravity. Schr. discovered, 1787, a *comes*, sometimes invisible.  $\beta$ ,  $192^{\circ}5$ :  $81''9$ , who adds a faint *comes* to this:  $10$ ,  $12^{\circ}5$ :  $114^{\circ}6$ :  $10''5$ , and finds two fainter and closer *comites* to Algol at  $155^{\circ}3$ ,  $144^{\circ}6$ :  $58''7$ ,  $67''7$ .

 Es.-Birm. 96. IV<sup>h</sup> 40<sup>m</sup>.1, N. 32° 47' : 8.7 : R. : h. III.

#### NEBULA AND CLUSTERS.

650, 651 (M. 76 and H. I 193). I<sup>h</sup> 37<sup>m</sup>.2, N. 51° 10'. Pearly w. neb., double, curious miniature of M. 27, and like it gaseous, *p* a little the brighter. E. of Rosse, spiral. Lick photo, the two joined and traces of ring.

869, 884 (H. VI 33, 34). II<sup>h</sup> 15<sup>m</sup>.1, N. 56° 47'. These two gorgeous clusters, described by Sm. as 'affording together one of the most brilliant telescopic objects in the heavens,' are visible to the naked eye as a protuberant part of the Galaxy, and so H. considers them. They are often called *The sword-hand of Perseus*. With 64 these superb masses were visible together, as well as a bright part *n*. 5½-in. showed a red star between them. Sm. mentions a ruby and a garnet in 884. 9½-in. shows 5 stars in all. T. T. Smith sees 8. Es. sees 9 in the cl. and outliers, all very similar in col., and spectrum (faint III type). The red stars are all associated with 884. Adams finds that the brighter stars in the cl. have nearly the same radial velocity.

Follow the curve of stars *n*, which leads into a glorious region at  $11^{\text{h}} 6^{\text{m}}$ , N.  $58^{\circ} 55'$ .

Beautiful field,  $11^{\text{h}} 14^{\text{m}}$ ,  $54^{\circ}$ .

957 (h. 227).  $11^{\text{h}} 27^{\text{m}}.8$ , N.  $57^{\circ} 10'$ . Wide cl., h. 13-15  $m^{\text{e}}$ ., a little *f* 869.

Group.  $11^{\text{h}} 31^{\text{m}}.0$ , N.  $55^{\circ} 37'$ , with reddish star. Es.

1039 (M. 34).  $11^{\text{h}} 36^{\text{m}}.9$ , N.  $42^{\circ} 26'$ . Just perceptible to naked eye; very grand low-power field, one of the finest objects of its class. It contains O $\Sigma$  44, which see.

1245 (H. VI 25).  $11^{\text{h}} 9^{\text{m}}.2$ , N.  $46^{\circ} 56'$ . A low power shows a very faint large cloud of minute stars (h. 12-15  $m^{\text{e}}$ .), beautifully bordered by a brighter foreshortened pentagon.

1528 (H. VII 61).  $11^{\text{h}} 9^{\text{m}}.1$ , N.  $51^{\circ} 2'$ . Bright cl., good low-power object; larger stars in curves. E. of Rosse,  $9\frac{1}{2} m^{\text{e}}$ ., red,  $30' sf$ , another  $2' f$ .

$11^{\text{h}} 30^{\text{m}}.9$ , N.  $50^{\circ} 53'$ . Centre of dark space, extending  $5^{\text{m}}$ . in R.A. and  $1^{\circ}$  in Dec., which Es. believes to be occupied by a body absorbing the light of the stars. Barnard has found several objects which he believes to be due to an absorption medium, one at  $18^{\text{h}} 7^{\text{m}}$ , S.  $18^{\circ} 15'$  especially remarkable.

## PISCES.

A dull region, containing some good telescopic objects.

type. Se. Magnificent object. Var., according

to Gould, but Chandler believes the apparent var. is due to the red col. Es., however, saw a well-marked max.  $5.2 m^e$ , 1884, Aug. 19, and places it as leader of a class of variables whose characteristics are spectrum IV type. Var. about  $1 m^e$ . Per. irregular. These stars for long intervals are nearly constant in light, and then for a short time rise to a max. Probably all the stars of type IV are subject to these fluctuations. In estimating magnitude of red stars it is well to put them out of focus, and thus compare *discs* of light instead of *points*. A binocular is a capital instrument for comparing together the magnitudes of the brighter stars. Webb notes a curious  $8 m^e$ . triangle II min. *f*,  $30' s$ .

30.  $xxiii^h 57^{m.8}$ , S.  $6^\circ 28'$  : 5 : YR. : III. Du.

#### NEBULA.

524 (H. I 151).  $1^h 20^{m.6}$ , N.  $9^\circ 7'$ . Round, brighter centre ; 4 stars near.

#### PISCIS AUSTRALIS.

A constellation of which the first magnitude, *lucida*, Fomalhaut ( $xxii^h 53^{m.2}$ , S.  $30^\circ 3'$ ) appears as a glittering object, low down in the south, below Aquarius.

- R (var.).  $xx^h 10^m.4$ , N.  $16^\circ 29'$ : 8.5-10.4:  $70^d.5$ , with double max., like  $\beta$  Lyræ. Baxendell.

## CLUSTER.

6838 (M. 71).  $xix^h 50^m.2$ , N.  $18^\circ 34'$ : large and dim, hazy to low powers with  $3\frac{7}{10}$ -in., yielding a cloud of faint stars (h. 11-16 m<sup>g</sup>.) to higher magnifiers. Rather more than  $1^\circ$  *sp*  $\gamma$ . About  $1^\circ$  *sp* is a beautiful low-power field, containing pair, and triple group, all about 8 or 9 m<sup>g</sup>.

## SAGITTARIUS.

The stars of this constellation have a beautiful effect above the S. horizon near the place where the Galaxy passes from sight in our latitude ; but they are apt to be obscured by haze. The Milky Way is here very rich in a transparent night, but we see only the N. edge of a splendid portion of it.

## CLUSTERS AND NEBULÆ.

6514 (M. 20). XVII<sup>h</sup> 57<sup>m</sup>.5, S. 23° 2'. The Trifid neb. closely *f* a cruciform group. Very curious object; pair with minute *comes* 'where three ways meet, dark rifts through nebulosity.'  $\beta$ , with 36-in., sees six stars with positions as follows:—

A B : 8, 10.6 : 22° 5' : 6".1. A C : 212° 3' : 10".7. C = 8.8. C D : 281° 7' : 2".2. D = 10.5. C E : 190° 8' : 6".2. E = 12.4. A F : 106° 4' : 22".1. F = 13.8. C G : 211° 9' : 29".6. Spect. not gaseous; yet La. and Holden report conspicuous change. Neb. imperfectly seen by Sm. as well as myself; rather low. Grand region.

6523 (M. 8). XVII<sup>h</sup> 58<sup>m</sup>.8, S. 24° 23'. Splendid Galaxy object; visible to naked eye. In a large field we find a bright, coarse triple star, followed by a resolvable luminous mass, including two stars, or starry centres, and then by a loose bright cl. enclosed by several stars: a very fine

combination. h., a set of milky streaks and loops. Se. suspects change, and finds the spectrum gaseous.<sup>1</sup>

6531 (M. 21). xvii<sup>h</sup> 59<sup>m</sup>.9, S. 22° 30'. In a lucid region.

6568 (H. VII 30). xviii<sup>h</sup> 7<sup>m</sup>.9, S. 21° 37'. Curious large undefined cloud of 10 m<sup>g</sup>. (h., 11-13 m<sup>g</sup>.) stars; requiring low power and steady gazing;  $\frac{1}{2}^\circ$  s of  $\mu^1$ .

6626 (M. 28). xviii<sup>h</sup> 19<sup>m</sup>.6, S. 24° 55'. Not bright. h., 14-16 m<sup>g</sup>. 1° *np*  $\lambda$ .

M. 25. xviii<sup>h</sup> 27<sup>m</sup>.2, S. 19° 11'. Coarse and brilliant. Not in G.C.

6656 (M. 22). xviii<sup>h</sup> 31<sup>m</sup>.5, S. 24° 3'. Beautiful bright cl., very interesting from visibility of components, largest 10 and 11 m<sup>g</sup>., which makes it a valuable object for common telescopes, and a clue to the structure of many more distant or difficult neb. h. makes all the stars of two sizes, 11 and

<sup>1</sup> At xvii<sup>h</sup> 57<sup>m</sup>, S. 18° 50' a little *np*  $\mu$ , is a spot referred to by Se. as exemplifying in a high degree the marvellous structure which his achromatic at Rome shows in the Galaxy. The remarks of this accomplished astronomer on the successive layers of stars are very curious: first he finds large stars and lucid clusters; then a layer of smaller stars, certainly below 12 m<sup>g</sup>.; then a nebulous stratum with occasional openings. But what, he says, startled him, and all to whom he showed it, was the regular disposition of the larger stars in figures 'si géométriques qu'il est impossible de les croire accidentelles. La plus grande partie sont comme des arcs de spirale; on peut compter jusqu'à 10 ou 12 étoiles de la 9me à la 10me grandeur . . . se suivant sur une même courbe comme les grains de chapelet; quelquefois elles forment des rayons qui semblent diverger d'un centre commun, et ce qui est bien singulier on voit d'ordinaire que, soit au centre des rayons, soit au commencement de la branche de la courbe, on trouve une étoile plus grande et rouge. Il est impossible de croire que telle distribution soit accidentelle.' He mentions, besides this spot, several instances in Cygnus. Compare the spiral discovered by the E. of Rosse in many nebulæ; and see also Sm.'s remark on M. 35.

15 m<sup>g</sup>., as if 'one shell over another,' and thinks the larger ones ruddy. Midway between  $\mu$  and  $\sigma$ .

6818 (H. IV 51). xix<sup>h</sup> 40<sup>m</sup>.5, S. 14° 21'. Plan., bl., like star out of focus. E. of Rosse, and D'A. darker centre; h. otherwise. Huggins, spect. gas. 2° n, a little *f* 54.

6864 (M. 75). xx<sup>h</sup> 1<sup>m</sup>.4, S. 22° 9'. Bright nucleus with low power. h., resolvable.

### SCORPIO.

A fine constellation, little noticed by casual star-gazers from its low altitude and short continuance above the horizon, with the additional disadvantage of its culminating during the brief summer's night. The student will do well to look out for it, and it will repay an hour or two of extra watching.

#### DOUBLE STARS.

2 ( $\beta$  36). xv<sup>h</sup> 48<sup>m</sup>.8, S. 25° 5' : 6, 8 : 279° : 3".

$\xi$  ( $\Sigma$  1998). xvi<sup>h</sup> 0<sup>m</sup>.0, S. 11° 10' : 4.9, 5.2 : 356° : 1".1 : yw. : '25. Bin. Per., Lewis, 97.8 years, A., 44.7 years. A., '12 : 157° 7' : 0".7, now widening. Third star, 7.2 : 78° 6' : 6".7 : '25. Jouffray, '03 : 63° 2' : 7".3. Probably a system like  $\zeta$  Cancri. Elong. ? '51. Beautiful field., s a little *f* is  $\Sigma$  1999 : 7.8, 8.1 : 102° 2' : 10".5 : w. (some obs. bl., or purp.), yw. Fr., '15, 99° 4' : 11".3. Sa., 11 m<sup>g</sup>. *f*.

$\beta$  (Hh. 494). xvi<sup>h</sup> 0<sup>m</sup>.8, S. 19° 36' :  $\Sigma$ , 2, 4 : 24° 4' : 13".1. Pale y., grnsh. ? '50.  $\beta$  doubled 2 : 10 : 93° 9' : 0".9.

11 ( $\beta$  39). xvi<sup>h</sup> 3<sup>m</sup>.2, S. 12° 32' : De., 6.1, 10.4 : 256° 5' : 3".3.

$\nu$  (Hh. 497). xvi<sup>h</sup> 7<sup>m</sup>.3, S. 19° 15' : De., 4.1, 7 : 336° 8' : 40".8. Mitchel and Jacob divided 7. De., 7, 8 : 47° 9' :

- 1"9: '75. I have seen it easily with 5½-in., Grover has even just separated it with 2-in. β, De., and others double 4; De., 4.1, 6.6: 360°: 0"7. All apparently fixed.
- 12 (h. 4839). xvi<sup>h</sup> 7<sup>m</sup>.3, S. 28° 12': See, 6, 8.7: 77°5: 4"1.
- Hh. 504. xvi<sup>h</sup> 15<sup>m</sup>.8, S. 19° 56': Wilson, 8.5, 9.5: 22°5: 12"7. Another pair in field *p*, (Hh. 503), a beautiful group.
- σ (Hh. 505). xvi<sup>h</sup> 16<sup>m</sup>.3, S. 25° 24': 3, 8: 271°2: 20"4. Spect. Bin.
- h. 4850. xvi<sup>h</sup> 19<sup>m</sup>.6, S. 29° 31': 6.5, 7: 352°1: 6"9.
- α (Antares). xvi<sup>h</sup> 24<sup>m</sup>.5, S. 26° 16'. This great star, Sm. justly terms fiery red; and it is a grand telescopic object. Its tint, however, is not uniform; to me the disc appears y., with flashes of deep crimson alternating with a less proportion of fine green, the latter mixture perhaps accounted for by the 7 m<sup>g</sup>. (first seen by Burg, 1819) star near enough to be usually involved in the flaming rays of the principal, forming an atmospheric, rather than optical test. De., 275°7: 3"7: '64. Fixed. D. noticed a curious proof of its independent, not contrasted grn. light, when it emerged, in '56, from behind the dark limb of the moon. Large star, III type, fine spectrum.

#### STARS WITH REMARKABLE SPECTRA, AND VARIABLES.

RR (var.).  $xvi^h 51^m.5$ , S.  $30^\circ 27'$ :  $7-12.1$ :  $281^d$ : Fleming.

## CLUSTERS.

6093 (M. 80).  $xvi^h 12^m.3$ , S.  $22^\circ 47'$ . Like a comet; in a beautiful field, halfway between  $\alpha$  and  $\beta$ . H. calls it the richest and most condensed mass of stars in the firmament, and speaks of it as on the W. edge of a vast starless opening  $4^\circ$  broad; in which, however, I found many minute stars. h., cl.  $14 m^e$ . Beautiful field. Nearly central, is the strange var., T, which, 1860, between May 18 and 21, had blazed out to  $7 m^e$ , extinguishing apparently the cl., had almost faded by June 16, and has never distinctly reappeared. In field, *f* a little *n*, are the two vars. R and S; the whole in singular juxtaposition.

6121 (M. 4).  $xvi^h 18^m.7$ , S.  $26^\circ 20'$ . Large, rather dim, resolvable, followed by a vacant starless space. h. has remarked many vacancies of this kind. See Appendix I.

6266 (M. 62).  $xvi^h 56^m.1$ , S.  $30^\circ 3'$ . h., fine cl., but very low.

## SCULPTOR.

A constellation very low in our latitudes, and containing no bright stars; it is situated below  $\beta$  Ceti.

## DOUBLE STARS.

See 2.  $0^h 3^m.7$ , S.  $22^\circ 57'$ :  $5.7, 12.3$ :  $174^\circ.3$ :  $2''.1$ .

#### CLUSTERS AND NEBULA.

6603 (M. 24). XVIII<sup>h</sup> 13<sup>m</sup>.8, S. 18° 27' : Magnificent region, visible to the unaided eye as a kind of protuberance of the Galaxy ; and so considered by h., who gives stars 15 m<sup>e</sup>. It is accompanied by two little pairs. 2° *n* of  $\mu$  Sagittarii.

6611 (M. 16). XVIII<sup>h</sup> 14<sup>m</sup>.5, S. 13° 49'. Grand cl.

6613 (M. 18). XVIII<sup>h</sup> 15<sup>m</sup>.2, S. 17° 10'. Glorious field in very rich vicinity ; *s* lies a region of surpassing splendour.

6618 (M. 17). XVIII<sup>h</sup> 16<sup>m</sup>.3, S. 16° 13' : The 'horseshoe' neb. visible in finder, 1° *n* of M. 18, described by Sm. as a magnificent, arched, and irresolvable nebulosity—in a splendid group of stars. Well has he observed, 'The wonderful quantity of suns profusely scattered about here would be confounding, but for their increasing our reverence of the Omnipotent Creator, by revealing to us the immensity of the creation.' The neb., however, Huggins finds to be gaseous ; and Holden traces some changes of position with regard to neighbouring stars.

6694 (M. 26). XVIII<sup>h</sup> 40<sup>m</sup>.8, S. 9° 29'. Coarse cl.

6712 (H. I 47). XVIII<sup>h</sup> 48<sup>m</sup>.7, S. 8° 48' : Beautiful resolvable neb.

## SERPENS.

A long rambling constellation, mixed with Ophiuchus. It contains some fine telescopic objects.

 $\theta$  ( $\Sigma$  2417). XVIII<sup>b</sup> 52<sup>m</sup>.2, N. 4° 6' : 4, 4.2 : 103° 8' : 21'' 6 : yw. Hu., '02 : 22'' 2. Sm. first suggested variability, and Gould found var. from 4.1 to 4.6. A difference of 1.3 m<sup>e</sup>. was noted between the stars at Harvard on one occasion. Relatively fixed with c.p.m. (11' n, Miss Brown sees a red star. Es., 8.5 : III.) This noble pair, in a very fine field, lies to the naked eye in a dark space between two streams of the Galaxy. There is a traditional misrepresentation of the latter in this region, where both streams were misdrawn and misplaced on the older globes and maps. Much fine sweeping occurs among moderate-sized stars between these branches, showing that the darkness to the naked eye is due to the absence of the unresolved background. In h.'s 'Outlines of Astronomy' is a very accurate description of the Galaxy, and it has been carefully delineated by Heis, Gould, and Boeddieker. And with the camera by Barnard, and Wolf, Franklin-Adams, Bailey.

## CLUSTER AND GROUPS.

- Group. ± xviii<sup>h</sup> 2<sup>m</sup>, S. 3° 10'. Bright open triangle.  
 Group. ± xviii<sup>h</sup> 22<sup>m</sup>, N. 1° 41'. Curious rhomboid: 8,  
 8, 10, 10.  
 6633 (H. VIII 72). xviii<sup>h</sup> 24<sup>m</sup>.6, N. 6° 29'. Very fine,  
 with star 7 m<sup>g</sup>. in large field; eye object. Baxendell found  
 var. T, among outliers; compare M. 80 in Scorpio. Between  
 it and θ, nearer the former, is a beautiful large cloud of  
 stars, chiefly 8 and 9 m<sup>g</sup>., a nearer part, apparently, of the  
 Galaxy; visible to naked eye, and requiring a large field.  
 Group. ± xviii<sup>h</sup> 34<sup>m</sup>, N. 5° 16'. Very large, subdivided,  
 chiefly 9 and 10 m<sup>g</sup>.

## SEXTANS.

A modern asterism, as its name denotes, being one of the minor constellations, formed by Hevelius out of unclaimed stars lying between the ancient ones.

## DOUBLE STARS.

## NEBULÆ.

- 3115 (H. I 163). x<sup>h</sup> 1<sup>m</sup>·2, S. 7° 20' Very distinct, with  
much brighter centre, bearing magnifying unusually well.
- 3166, 3169 (H. I 3, 4). x<sup>h</sup> 9<sup>m</sup>·6, N. 3° 49'. Two very

faint nebulæ in a glorious field. H. missed the fainter, though he observed the other 4 times. D'A. saw 3, and called H. I 3 *admodum luminosa*. Such was the working of the Copenhagen 11-in.achr.

### TAURUS.

An interesting constellation containing two beautiful groups familiar to the first beginner in stellar astronomy, The Pleiades, and Hyades. Neither of these, however, is sufficiently concentrated to make a good telescopic object, excepting in an unusually large field. The 6 principal stars of the Pleiades are evident to any clear sight; but glimpses of more are easily attainable. Möstlin is said by Kepler to have distinctly made out 14, the relative positions of 11 being estimated with surprising accuracy in the absence of a telescope. Carrington and Denning have seen 14; even 16 are spoken of by Carl von Littrow, who says 11 are not unfrequently perceived. A beautiful triangle of small stars will be found near the *lucida*, Alcyone ( $\text{III}^{\text{h}} 42^{\text{m}}.7$ , N.  $23^{\circ} 52'$ ). I have noticed the remarkable absence of colour in the group, except in one minute ruby star, and an or. outlier. Wolf has charted 499 stars here down to 14  $\text{m}^{\text{e}}$ . The photographic plate shows over 2000.

Pickering found bright lines in Pleione which were confirmed by Keeler, but since 1905 the lines have been dark. In Alcyone Campbell sees red hydrogen line bright while the others are dark. Merrill finds a similar combination in Electra, while in Merope, F is also bright. Spect. Obs. suggests that the nebula is not gaseous. In the case of the Hyades, Boss finds 41 stars whose p.m. converge to near  $\gamma$  Tauri.

## DOUBLE STARS.

- $\Sigma$  380.  $\text{III}^{\text{h}}$   $17^{\text{m}}.4$ , N.  $8^{\circ} 29'$ :  $8.3$ ,  $9.3$ :  $90^{\circ}.1$ :  $1''.2$ .  $\beta$ ,

gold, o. Aldebaran, in Arabic, *the hindmost*,  
because he seems to drive the Pleiades before  
him. The minute attendant is a good light test.  
D. has seen it with  $2\frac{3}{4}$ -in., Wa. with  $1\frac{7}{8}$ -in.<sup>1</sup> My  
 $3\frac{7}{10}$ -in. showed it certainly, but not without much  
attention; 144 suited it better than 80. De.  
makes it  $10.3$ .  $\beta$  divides it into 11,  $13.5$  :  $279^\circ$  :  
 $1''.8$ , which may be moving; he also detected a  
fainter attendant  $109^\circ.0$  :  $31''.4$ , which has the  
same p.m. as  $\alpha$ , whereas the pair is gradually  
being left behind (Fr., '14 :  $34^\circ.2$  :  $119''.9$ ). Occul-  
tations of Aldebaran are not infrequent, as it lies  
in the Moon's way; they are striking phenomena,  
and to some observers are apt to exhibit the  
singular optical illusion of *projection*. Aldebaran  
is a beautiful example of the II or solar type of  
spectrum. Goodacre, pair  $62^s$  p. Es., 11.7, 11.7 :  
 $331^\circ.2$  :  $3''.7$ .

## NEBULÆ AND CLUSTERS.

1435. III<sup>h</sup> 4I<sup>m</sup>.4, N. 23° 32'. Nebula in Pleiades, discovered by Tempel, 1859; a faint, extended, somewhat triangular haze, involving, at its *n* extremity, Merope, the bright star *sp* Alcyone, the *lucida* of the group. Suspected var., but evidence conflicting. Has been seen with less than 2-in., but invisible in the 11-in. achr., at Copenhagen, possibly from want of contrast in diminished fields; D'A. says there are nebulae invisible or barely seen in great telescopes, which can be perceived easily in their finders. Wolf is certain that it has not changed since '64. Found readily with 5½-in., '63, Oct. 6. Very feeble, '65, Sept. 25; a mere glow when star out of field, 9-in. spec., '72, March 4; '76, Jan. 15, in presence of star, 9½-in. spec., 1881, Jan. 31. Goldschmidt saw it as a projection from a diffused nebulosity encompassing Pleiades; so Wolf. Temple thinks this an illusion, but it has been confirmed by photography. The photo. of the brothers Henry shows a remarkable nebulous wisp attached to Maia, and a curious narrow ray running through 6 stars for 2½' *f*.

1647 (H. VIII 8). IV<sup>h</sup> 4I<sup>m</sup>.4, N. 18° 55'. Stars 8.5 to 10, round wide pair.

1758 (H. VII 21). IV<sup>h</sup> 59<sup>m</sup>.6, N. 23° 40'. Interesting region.

1952 (M. I). V<sup>h</sup> 29<sup>m</sup>.7, N. 21° 58': oblong; pale; 1° *np* ζ. Crab neb. of E. of Rosse, who considered it resolvable, with fringes, not, however, subsequently confirmed there. Se. obtained a similar result. Granular, 9½-in. spec. D'A., 5½' × 3½', not resolved. First seen by Bevis, 1731. Its accidental re-discovery by M., while following a comet in 1758, led to the formation of the earliest catalogue of nebulae. Winlock, gaseous spect.

## TRIANGULUM.

An ancient constellation, including several good objects.

## DOUBLE STARS.

- $\Sigma$  137.  $1^h 30^m.9$ , N.  $20^\circ 52'$  :  $8.2, 9$  :  $86^\circ.6$  :  $3''.4$ .

 Es.-Birm. 55.  $11^{\text{h}} 39^{\text{m}}.2$ , N.  $32^{\circ} 2'$  : neb., with 7.5 *f*, R.  
 h. III. Se.

## NEBULA.

598 (M. 33).  $1^{\text{h}} 29^{\text{m}}.3$ , N.  $30^{\circ} 15'$ . Very large, faint, ill defined, visible from its great size (h., nearly  $\frac{1}{2}^{\circ}$  *n* and *s*, in finder). A very curious object, only fit for low powers, being actually imperceptible, from want of contrast, with my 144. E. of Rosse, who saw it full of knots, found spiral arrangement ; two similar curves like an S cross in the centre. Ritchey, who photographed it with the 24-in. at the Yerkes Observatory, with 4 hours' exposure, notes that the central parts appear decidedly nebulous, the outer parts consist of very faint nebulosity, and of numerous curved streams, or wisps of nebulous stars ; hundreds of these star-like condensations are shown on the original negative. Closely *nf* is H. III 150, a small, bright, round neb. with gaseous spect.

## URSA MAJOR.

This familiar constellation offers a large field to the persevering observer. It must be borne in mind that it extends far beyond the region occupied by 'the seven stars ;' and, from the unmarked character of some parts of it, several telescopic objects will require care in their

identification. It seems difficult to ascertain whence this Bear and his companion derived their preposterous length of tail. Dr. Mather, in 1712, tells a curious story, that though the Red Indians did not divide the stars into constellations, they called the stars of Ursa Major 'Paukunawaw,' that is, the Bear, long before they had any communication with Europeans.<sup>1</sup> H. considered that in '38  $\epsilon$  was the leader of the 7; but in '47, by far,  $\eta$ ; Fr., in '78,  $\epsilon$  decidedly *lucida*, and sequence  $\epsilon \eta \zeta \alpha \beta \gamma \delta$ .  $\zeta$  was the first spectroscopic Binary discovered, in '88, Mrs. Fleming having found that the lines were doubled at intervals. Period, 20<sup>d</sup>.54.  $\alpha, \beta, \epsilon$  are also spec. Binaries. Of the early type stars at least one in three are spec. Binaries.

## DOUBLE STARS.

 grnsh. w. This fine pair, which is said to have  
 been discovered by Riccioli, and again noticed,  
 1700, Sept. 7, by Gottfried Kirch, and his scientific  
 wife, Maria Margareta, are probably travelling  
 together through space, and in very slow orbital  
 motion, it forms a noble group with Alcor,<sup>1</sup>  $5 \text{ m}^{\text{s}}$ .  
 (five distant *comites*, Es.),  $11\frac{1}{2}'$  distant (the 'rider  
 upon the horse'), and another star,  $8 \text{ m}^{\text{s}}$ ., which,  
 however, is said to have been seen without a  
 telescope.  $\zeta$ , or Mizar, and Alcor, form a pair to

<sup>1</sup> Brightening? K. Certainly no longer the severe naked-eye test, which it used to be, even in the Arabian sky.

the naked eye, and thus become an excellent object for a beginner, as the telescopic increase of brightness and distance admits of direct comparison; but the inversion of the astronomical eye-piece must be borne in mind, or the identity will be perplexing.  $\zeta$  was the first pair photographed by Bond, and with very encouraging success. Spec. Bin.

## NEBULÆ.

2841 (H. I 205). IX<sup>h</sup> 16<sup>m</sup>.5, N. 51° 19'. Large, oval, bright, with nucleus. D'A., *illustris, prægrandis*. E. of Rosse, like Androm. Neb. Dull object,  $3\frac{7}{10}$ -in., in fine field with 37, 6 m<sup>s</sup>.,  $1\frac{1}{2}^{\circ}$  *sp*  $\theta$ . Several pretty little pairs in neighbourhood. L.P., spiral.

2985 (H. I 78). IX<sup>h</sup> 43<sup>m</sup>.2, N. 72° 39' : bright. D'A., resolvable ?

3031, 3034 (M. 81, 82). IX<sup>h</sup> 49<sup>m</sup>.0, N. 69° 26'. Two neb.  $\frac{1}{2}^{\circ}$  apart; 81 bright, with vivid nucleus, finely grouped with small stars, two of which are projected upon the haze, to which h. gives nearly 15' of length. Two little pairs *sp*, making the field very interesting. The nearer is  $\Sigma$  1387 : 9.5, 9.5 : 269° 6' : 8".9; the further is  $\Sigma$  1386 : 8.2, 8.2 : 296° : 2". 82 (Bode's neb.), curious narrow curved ray. D'A.,  $7' \times 100''$ , two nuclei, and sparkling as if resolvable, which 81 is not. Huggins finds both spectra continuous, but deficient at the red end, like the Androm. neb., etc. L.P., spiral; spect. one absorption and two bright lines.

3556 (H. V 46). XI<sup>h</sup> 6<sup>m</sup>.8, N. 56° 6'. Large, faint, well-defined, elongated, rather curved: small star in centre.  $1^{\circ}$  *sf*  $\beta$ . L.P., probably spiral.

3587 (M. 97). XI<sup>h</sup> 10<sup>m</sup>.0, N. 55° 27'. Large pale plan. neb.; very remarkable object. h.,  $2' 40''$ , which at distance of 61 Cygni only, would equal 7 times orbit of Neptune.

THE OWL NEBULA, M. 97, URSÆ MAJORIS.

*Photographed at the Lick Observatory.*

He saw light nearly equable, though with softened edge, and faintly bicentral. E. of Rosse, on the contrary, two large perforations (whence it has been called the 'Owl Neb.'), and an indistinct spiral structure. Before 1850 there was a star in each opening; since, one only. Huggins, gas-spectrum;  $2^{\circ} sf\beta$ . L.P. shows an outer ring. Barnard three faint stars, the central one variable. Mt. Wilson 5 stars. 100 small neb. in field.

3610 (H. I 270). XI<sup>h</sup> 13<sup>m</sup>.8, N. 59° 17'. Bright, not large. D'A., haze round star-like nucleus.

3613 (H. I 271). XI<sup>h</sup> 14<sup>m</sup>.0, N. 58° 26'. Elongated; nucleus.

3675 (H. I 194). XI<sup>h</sup> 21<sup>m</sup>.8, N. 44° 2'. Large, elongated; star-dust *p*.

3941 (H. I 173). XI<sup>h</sup> 48<sup>m</sup>.8, N. 37° 26'. Large in dark nights; central blaze.

4026 (H. I 223). XI<sup>h</sup> 55<sup>m</sup>.3, N. 51° 24'. D'A., unusual phenomenon; very unlike other neb. of the region. Star 10<sup>m</sup>. in centre of slender sharp-pointed ray, 4' × 20".

4258 (H. V 43). XII<sup>h</sup> 15<sup>m</sup>.0, N. 47° 45'. Large, oval, bright, best defined at sides; nucleus *s*, like Androm. neb. on small scale. D'A., 10' × 2½'. Spectrum continuous. L.P., spiral.

5322 (H. I 256). XIII<sup>h</sup> 46<sup>m</sup>.6, N. 60° 35'. Bright; nucleus.

### URSA MINOR.

This constellation is distinguished by a still more inappropriate length of tail than its larger neighbour, by which, as Sm. observes, it is swung round every twenty-four hours. At its extremity stands the most valuable star in the heavens, Polaris, 1° 7' from the polar point, which, from the

precession of the equinoxes, it will approach as near as  $26' 30''$ , its nearest, A.D. 2095.

## DOUBLE STARS.

- $\alpha$  ( $\Sigma$  93).  $1^h 31^m.7$ , N.  $88^\circ 53'$ : 2, 9:  $210^\circ.1$ :  $18''.3$ : y., w. Fr., '14:  $216^\circ.1$ . Spec. Bin., and slightly var. D., 9 blsh. as I see it. Common test, but only suited for small apertures, being easy with anything much exceeding 2 in. D. has proposed it as a general standard, finding that 80 on 2-in. will show it if the eye and telescope are good; he has glimpsed it with  $1\frac{3}{10}$ -in.achr. Dawson has glimpsed it with 1-in. T. T. Smith sees it with  $1\frac{1}{4}$ -in. refl. In Dorpat achr. it has been perceived by day. De. gives it  $8.4 m^e$ .  $\beta$ , comes, 15:  $83^\circ.3$ :  $44''.7$ .

### VIRGO.

A constellation especially remarkable for those possessed of adequate optical means, on account of the wonderful *nebulous region*, in which a far greater number of these extraordinary bodies are accumulated than in any other equal area of the heavens, H. having detected within its boundaries no less than 323. Few of them, however, are individually interesting; it is the mysterious thronging together of these objects, whatever may be their nature, that opens such a field for curiosity. They are in general so much alike that I have only adduced a few as specimens. They are profusely scattered over this quarter of the sky; but the region more especially referred to is pretty well defined to the naked eye by the stars  $\epsilon$ ,  $\delta$ ,  $\gamma$ ,  $\eta$  and  $\beta$  Virg. and  $\beta$  Leonis.

Spica, the leader, was found by Vogel to be a spec. Bin. Per., 4 days.

 '25. This wonderful pair has been widening ever  
 since they closed up out of all telescopic reach in  
 1836 (except at Dorpat, where 848 still showed  
 elongation, 151° 6 : 0".3) and a very moderate  
 instrument will now suffice for them. Now at  
 nearly greatest distance. Ph., '14 : 325° 4 : 6".  
 $\beta$ , period 193.7 years. Lewis, 182 years. Ha.,  
 greatest dist. 6".3, least 0".5.  $\Sigma$  thought them  
 alternately var., with possible period of at least  
 several yrs. Humboldt suggested slow axial rota-  
 tion in each.  $\beta$ , comes, 14.5 : 159° 4 : 53".1, and  
 pair in field ( $\beta$  607), 3<sup>s</sup> p : 8.5, 11 : 315° 8 : 1".2.  
 Fixed.

## NEBULÆ.

4192 (M. 98). XII<sup>h</sup> 9<sup>m</sup>.7, N. 15° 21'. Long ray. h., 10' ; D'A., nucleus.

4216 (H. I 35). XII<sup>h</sup> 12<sup>m</sup>.8, N. 13° 36'. Long, shuttle-like nucleus. E. of Rosse, 15'.

4254 (M. 99). XII<sup>h</sup> 14<sup>m</sup>.8, N. 14° 52'. E. of Rosse, wonderful spiral. Key, resolvable, 18-in. 'With' spec. So D'A.

4303 (M. 61). XII<sup>h</sup> 17<sup>m</sup>.8, N. 4° 55'. Faint ; bright centre, E. of Rosse, spiral.

4406 (M. 86). XII<sup>h</sup> 22<sup>m</sup>.1, N. 13° 23'. h., very bright, resolvable ? *nf*, G.C. 4435, 4438. In this neighbourhood Lowe sees 7 nebulae in large field with fine 15½-in. Calver.

4472 (M. 49). XII<sup>h</sup> 25<sup>m</sup>.7, N. 8° 27'. Bright ; D'A., *illustris, grandis*, and resolved. Faint haze in beautiful position between two 6 m<sup>e</sup>. stars. Bright open pair *s*, 3<sup>7</sup>/<sub>10</sub>-in.

4501 (M. 88). XII<sup>h</sup> 28<sup>m</sup>.0, N. 14° 52'. Long, pale ; D'A., 7' × 1½' ; nucl. In wonderful nebulous region. h., ray 8' × 1'. E. of Rosse, spiral ? Marvellous region as swept with 64 ; identification difficult.

4526 (H. I 31). XII<sup>h</sup> 30<sup>m</sup>.0, N. 8° 8'. h., very bright.

4594 (H. I 43). XII<sup>h</sup> 35<sup>m</sup>.8, S. 11° 11'. Long, h., 5' × 30", nucl. and dark cleft. Beautiful low-powered field : fine and singular 7 m<sup>e</sup>. group *np*.

4649 (M. 60). XII<sup>h</sup> 39<sup>m</sup>.6, N. 11° 59'. Double ; *p*

extremely faint. Not seen  $3\frac{7}{10}$ -in. In large field with M. 59 *np*, and H. II 70 *sp*, like a hazy star.

4697 (H. I 39). XII<sup>h</sup> 44<sup>m</sup>.5, S. 5° 22'. h., very bright.

4699 (H. I 129). XII<sup>h</sup> 44<sup>m</sup>.9, S. 8° 14'. h., very bright.

4754, 4762 (H. II 74, 75). XII<sup>h</sup> 48<sup>m</sup>.3, N. 11° 45'. In one field. 4762 like a paper kite; beautifully grouped with 3 stars. D'A. and E. of Rosse, long bright ray, nucl.

5634 (H. I 70). XIV<sup>h</sup> 25<sup>m</sup>.4, S. 5° 37'. Small. h., resolved, stars 19 m<sup>e</sup>. D'A., beautiful, bl. with Red star (Es.-Birm. 404), 8 m<sup>e</sup>. (var. ? Es.) *sf*. Prettily grouped.

5846 (H. I 128). XV<sup>h</sup> 2<sup>m</sup>.4, N. 1° 55'. h., very bright.

### VULPECULA AND ANSER.

Two little modern asterisms, arranged by Hevel. Grand sweeping; few coloured stars.

## NEBULA.

Some of my readers may perhaps feel that I have allotted an undue proportion of space to minute and inconspicuous objects. It may be so. I may have erred in supposing that others might receive as much pleasure as myself from their contemplation : yet a multitude, especially of the minuter pairs, have been passed by, as well as a great mass of remarks on the beauty or singularity of those which have been selected. But, should I have failed in communicating to others a portion of my own interest as to some parts of this list, it will be closed with a nebula which I think will not be found disappointing.

THE DUMB-BELL NEBULA, M. 27, IN VULPECULA.

*Photographed at the Lick Observatory*

6853 (M. 27). XIX<sup>b</sup> 56<sup>m</sup>. I, N. 22° 30'. The 'Dumb Bell' Nebula, just visible with a 1½-in. finder. In a rich field we find two oval hazy masses in contact, of which *p* seems to me the brighter, as it did to H. His reflector failed to resolve it, but showed the dark notches (which, as Darby remarks, are usually represented too deep) filled in and made protuberant by faint luminosity, converting the whole figure into an ellipse. The Earl of Rosse's 3-ft. speculum was thought to reach its starry components: his 6-ft. surrounds it with an external ring having a neck like a retort. Bond's achr. also seemed to resolve it, but there, as in D'A.'s figure, the form shown in small instruments is lost. The minute stars in it, of which I picked out two or three with 5½-in. achr., and 8-in. silvered glass, and Denning sees 7 with 10-in. spec., are admirable tests for superior telescopes. Ingall has claimed 18 with 5½-in. dialyte, from keenness of vision, and Se. has drawn many more. They seem, however, to be merely part of the host of the Galaxy; for Huggins finds there, by simultaneous comparison, nothing but luminous gas. A star in the centre, 13 m<sup>e</sup>., but on photos 11·7 m<sup>e</sup>., is probably the nucleus. And here the magnificent apostrophe of Kepler, which closes his speculations on the habitability of our own Sun, may well express our feelings, and form at the same time a most appropriate conclusion to the varied scenes which have passed in review since we commenced these pages:—

'Abrumpo consultò et somnum et speculationem vastissimam: tantum illud exclamans cum Psalte Rege:

'Magnus Dominus noster, et magna virtus ejus, et sapientiæ ejus non est numerus: laudate eum cœli, laudate eum Sol, Luna, et Planetæ, quocunque sensu ad percipiendum, quâcunque linguâ ad eloquendum Creatorem vestrum utamini: laudate eum harmoniæ cælestes, laudate eum vos

harmoniarum detectarum arbitri : lauda et tu anima mea  
Dominum Creatorum tuum, quamdiu fuero : namque ex ipso  
et per ipsum et in ipso sunt omnia, καὶ τὰ αἰσθητὰ καὶ  
τὰ νοερά ; tam ea quæ ignoramus penitus, quam ea quæ  
scimus, minima illorum pars ; quia adhuc plus ultra est.  
Ipsi laus, honor, et gloria in sæcula sæculorum ! AMEN.'

## APPENDIX I.

### STARLESS FIELDS.

Several of these curious vacancies, through which we seem to gaze out into an uninterrupted infinity, have been mentioned by H. ; but an extended list is to be found in the Cape Observations of his son, from which the following are selected as favourably situated for observation in northern latitudes. They are interesting not only from their peculiar aspect, but from the facility which they obviously afford for the detection of variable stars. The places have not been altered from the last edition, it being unnecessary for this class of Objects.

## APPENDIX II.

## SOUTHERN TELESCOPIC OBJECTS.

## DOUBLE STARS.

The following list has been kindly drawn up by Professor Innes, of the Union Observatory, Johannesburg. It contains stars brighter than 6.5, and with less distance than 20'', south of Decl. 31°, and thus follows out the scheme of the northern section of this vol. Mr. Innes is strongly convinced that it is better in the case of a double star to give the difference of magnitude between the stars rather than absolute magnitudes. In the second col. of the table therefore the magnitude is that of the brighter star, and in the third the difference between them. Under the heading 'Date,' the latest measures are given. Mr. Innes has supplied an elaborate series of notes, the most important of which will be found at the end of the table.

## NOTES.

- (1)  $\beta^2$  Toucani. Bin., angle decreasing  $3^\circ$  a year. Comes, decidedly yellow, although spectrum is A. 3rd bright star near.
- (2)  $\beta$  Phœnicis. Bin., in slow retrograde motion. 11 m<sup>s</sup>., 40", *nf*.
- (3)  $\kappa$  Toucani. Yellow, purp. or blsh. Bin., slow retrograde motion, distance nearly constant at 5". I. 27, 319" *np.*, m<sup>s</sup>. 7'3, is in direct motion. It has a similar P. motion with  $\kappa$ , and forms a quadruple system.
- (4)  $p$  Eridani. Bin. Gore, 302 yrs. Dist. increasing till 1975. Position angle decreases  $2^\circ$  in three years. Assuming that the mass of this system is equal to that of the sun, its parallax would be 0"·16 (20 light years); or if it is assumed that its luminosity is equal to the sun's, its parallax would be 0"·09 (36 light years).
- (5) h. 3475. Slow increase in angle.
- (6)  $\theta$  Eridani. Very slow increase of angle. Spect. Bin.
- (7) I 55. Triple system, both *comites* in retrograde motion.
- (8)  $\Delta$  23. Fine binary. h. '35 :  $342^\circ 5' : 3'' 9$ .
- (9)  $\beta$  755. A 10 m<sup>s</sup>. at 21".
- (10) J 159. Orange, bl.
- (11) h. 3997. Angle increasing slowly.
- (12) Howe 8. Change doubtful; good colour contrast.
- (13) N Puppis. A 13 m<sup>s</sup>. at 23".
- (14) V Puppis. Spect. Bin.
- (15) I 195. Chief star orange.
- (16) h. 4125. Angle increasing.
- (17)  $\delta$  Argûs. Retrograde motion. 11 m<sup>s</sup>. 69" away.
- (18) H Velorum. Fine colour contrast.
- (19)  $\psi$  Argûs. Fine binary discovered by Copeland.
- (20)  $j$  Velorum. Slightly var. in magnitude, and *var.* spectrum.
- (21)  $\mu$  Argûs. Very fine col. contrast.
- (22) Russell 161. Angle increasing slowly.
- (23)  $\epsilon$  Chamelionis. Slow increase in angle.
- (24) I 423. Good colour contrast.
- (25)  $\alpha$  Crucis. This fine double is prettily situated. It shows no sign of motion, indicating that although its luminosity is high, its mass must be remarkably small.
- (26)  $\gamma$  Centauri. Bin. Per. 88 yrs. (See.). 14 m<sup>s</sup>. 40" *sf*.
- (27)  $\beta$  Muscæ. Disc. by Russell, '80. Angle increasing slowly.
- (28) I 424. Several faint stars about 50" dist.
- (29) Sellors 18. An 8 m<sup>s</sup>. 38" *nf*.
- (30) I 365. Bin. ? c.p.m. Three dist. *comites*.
- (31) I 223. Marked col. contrast.
- (32)  $\beta$  343. Motion.
- (33)  $\gamma$  Centauri. Angle increasing.
- (34) Russell 227. Angle increasing.
- (35)  $\beta$  1197. Angle increasing.

- (36)  $\eta$  Centauri. Spect. composite and var.
- (37)  $\alpha$  Centauri. This fine double star is the nearest star to the solar system. Bin. Per. 83.6 yrs. (Doberck). According to this orbit the place in 1918 should be P.  $221^{\circ}5$ , D.  $15''2$ . The closest approach,  $4''$ , will take place in 1939. In mass and spect. the chief star resembles the sun. Several faint stars in field, none of which belong to the system.
- (38)  $\alpha$  Circini. Remarkable colour contrast, yellowish, and red; angle slowly decreasing.
- (39)  $\pi$  Lupi. Arrest of motion since 1886.
- (40) h. 4734. Angle increasing.
- (41)  $\mu$  Lupi. Slow motion.  $\Delta$ ., 3rd star,  $7.2 m^{\epsilon}$ .  $23'' sf$ .
- (42)  $\epsilon$  Lupi. Slow decrease in angle;  $9 m^{\epsilon}$ .  $27'' s$ .
- (43)  $\gamma$  Lupi. A puzzling pair, found by h. '35, measured by Jacob, '53 and '56. Single at Sydney, '71-'96. Seen and measured by I., '00-'10. All angles comprised between  $88^{\circ}$  and  $95^{\circ}$ .
- (44)  $d$  Lupi. Angle increasing.
- (45)  $\iota$  Normæ. Close pair. Binary.
- (46) L 6912. A beautiful multiple star. Spect. of chief star peculiar in having the hydrogen lines narrow. Group of stars  $f$ .
- (47) L 7194. Binary. Good colour contrast.  $11.5 m^{\epsilon}$ . star  $p$ .
- (48) L 7215. Ternary, with p.m. of  $1''15$ . Per. slightly greater than 50 yrs.
- (49) L 7213. Many faint stars near.
- (50) h. 4979. Slow decrease in angle.
- (51)  $\beta$  1123. In a large cluster.
- (52) h. 5014. Bin., decrease in angle; and widening.
- (53) h. 5015. Slow decrease in angle.
- (54)  $\xi$  Pavonis. Good colour contrast.
- (55)  $\gamma$  Coronæ Aust. Binary. Per. 152 yrs. Distance will increase to  $3''5$  (1953).
- (56) h. 5173. c.p.m. of  $1''6$ .
- (57) Russell 321. Binary, in slow motion.
- (58) Rümker 26. Slow decrease in angle.
- (59) L 8625. I doubled  $5.8$  in 1898.
- (60)  $\delta$  Toucani. Colour contrast.

## ADDITIONAL DOUBLE STARS.

- Hu. 1345.  $1^h 31^m 2$ , S.  $57^{\circ} 25'$ :  $6.5$ ,  $12 : 201^{\circ} : 5''4$ .
- $\gamma$  Argûs.  $viii^h 7^m 1$  S.  $47^{\circ} 5'$ :  $2.2$ ; has a bright companion at  $42''$  and two other bright stars near it, making it one of the most beautiful objects in the heavens. Spect. of bright lines.
- Brisbane 3574.  $xi^h 21^m 2$ , S.  $61^{\circ} 13'$ :  $7.8$ , red. One of the most remarkable binaries by reason of its faintness and separation (h.  $6''4$ , '38; I.,  $60^{\circ}3$ :  $2''1$ , '11).

## NOTES.

$\eta$  Argûs. 1677, 4 m<sup>g</sup>.; 1751, 2 m<sup>g</sup>.; 1811-15, 4 m<sup>g</sup>.; 1822-6, 2 m<sup>g</sup>.; 1827, 1 m<sup>g</sup>.; 1828-33, 2 m<sup>g</sup>.; 1838-43, 1 m<sup>g</sup>.; 1843-50, nearly or quite equal to Sirius, with some strange fluctuations, 1845-48. Lost to nearly all eyes, '62, or as others, '64. 5 m<sup>g</sup>., '65; 6·8, 1892, Roberts. 1899-1914, no var.; 7·8 m<sup>g</sup>., Innes. The spectrum, according to Pickering and Gill, is similar to that of a Nova. There is a similarity with P Cygni, not only in its fluctuations, and in having become apparently constant, but also both are situated near the bifurcation of the Milky Way, both are in the richest regions of Type V stars.  $\eta$  Argûs was seen by h., '38, encompassed by dense nebulosity. '60-62, Powell noticed it much fainter and changed in form. Ellery found rapid change. The photographs of this object, now rapidly accumulating, will settle the question. It is quite possible that with the fluctuations of  $\eta$ , the nebula also changed. Innes, 1914, found a *comes*, 10·5 : 74° : 1".

Canopus was thought, '61, in Chili brighter than Sirius (A. N., 1311).

$\epsilon$  Crucis. Lettsom, '60, found this star 6 m<sup>g</sup>. instead of 4 m<sup>g</sup>. as in map. Houzeau, '75, 4·5.

## D.—CLUSTERS AND NEBULÆ.

The two magellantic clouds, or Nubecula Major and Minor, are of the most complex nature; large tracts of nebulosity, irresolvable, and in every stage of resolution, with clustering groups, nebulæ of all kinds, globular clusters and nebulous objects of unique character. The N. Major contains 278 clusters and nebulæ with 50 or 60 outliers, the Minor 37 with 6 adjacent. Photos with the Bruce 24-in. telescope reveal twenty stars of Type V., fifteen gaseous neb., and eight stars with bright lines in the N. Major. Also there are 808 var. stars. Es., utilizing the fact that stars of Type V mark out the Equator of our Universe, has charted the stars of Type V in the N. Major, and found that the elements obtained, using them as the Equator, show:

Semi-Major Axis .....	2° 35'
Position.....	213°
Eccentricity .....	0·84
Inclination .....	33°

whence it is obvious that the mixing up of Galactic and non-Galactic objects is due to the inclination in the line of sight. A V Type star and a 'white' neb. may be in the same field and yet through the inclination, while the V Type is on the equator the white neb., being on the opposite side of the sphere, would be situated at a distance from the equator. The N. Minor is much smaller, and only one V Type star has been found therein.

No.	R.A. 1920.		Decl.	H's Description.
	h.	m.		
104.	0	20·5	72 32	47 Touc. Most glorious glob. cl.; stupendous object, completely insulated, stars all 12-14 m <sup>e</sup> . Central blaze ruddy, rest white.
292.	48·6		73 47	Centre of N. Minor, a partially resolved cloud, 11-18 m <sup>e</sup> . in a most barren region.
330.	53·5		72 54	Bright knot of 13-15 m <sup>e</sup> . stars.
362.	59·6		71 16	Cl. 13-14 m <sup>e</sup> .; central blaze.
1316.	III 19·6		37 31	Bright neb.; stellar nucleus, 2". Another 7' n.
1365.	30·6		36 24	V. bright nucleus, resolvable? between two lengthened parallel clouds of haze.
1387.	33·9		35 47	Bright cl.
1399.	35·4		35 43	Ditto, resolved?
1436	40·4		36 23	Bright cl.
